OIt. regale, a regal, It. regale, a hand-organ (Sp.

portable organ, much
used in the sixteenth
and seventeenth cen-
turies, consisting of
one or sometimes two
sets of reed-pipes
played with keys for
the player's right
hand, with a small
bellows for the left
hand. Its compass
included only a few tones.
In many cases the instrument
was made to shut up
within covers, like a large
box: hence the name
Bible-organ. If there was
but one pipe to each note,
the instrument was called
a *single regal*, if two pipes
to each note, a *double regal*. The invention of the regal
is often erroneously ascribed to Roll, an organ-builder of
Nuremberg, in 1575; the instrument was common in Eng-
land in the reign of Henry VIII. It is now obsolete, but
the name is still applied in Germany to certain reed-stops

of the organ. In England a single instrument was usually called a *pair of regals*.

The word *Regulation* was proposed by Dr. Hooker to express the freezing together of two pieces of thawing ice observed by Faraday; and the memoir in which the term was first used was published by Mr. Huxley and Mr. Tyndall in the Philosophical Transactions for 1857.

The act of regenerating or producing anew.—2. In *theol.*: (a) A radical change in the spirit of an individual, accomplished by the di-

rect action of the Spirit of God. Evangelical theologians agree that there is a necessity for such a radical spiritual change in man in order to the divine life; but they differ widely in their psychological explanations of the change. They are, however, generally agreed that it consists of or at least necessarily involves a change in the affections and desires of the soul. Regeneration is also understood, as by the Roman Catholic Church, to be the gift of the germ of a spiritual life conferred regularly by God's ordinance in baptism, which is accordingly called the *sacrament of regeneration*, or simply *regeneration*. The word *regeneration* occurs only once in the New Testament in its ordinary theological meaning; but equivalent expressions are found, such as "begotten again," "born again," "born of God," "born of water and of the Spirit."

2. In *metal.*, a chamber filled with a checker-work of fire-bricks; that part of a regenerative furnace in which the waste heat of the gases escaping from the hearth is, by reversal of the draft at suitable intervals, alternately stored up and given out to the gas and air entering the furnace. The idea of employing what is now generally called the "regenerative system" of heating was first conceived by Robert Stirling, in 1816, but his arrangement for carrying it out was not a practical one. The present form of the furnace, and in general the successful application of the principle, constituting a highly important improvement in the consumption of fuel, are due to the brothers Siemens. The regenerative system has already been extensively applied in various metallurgical and manufacturing processes, and is likely to receive still further development. According to the Siemens regenerative method, there must be at least one pair of regenerative chambers, in order that the heat may be in process of being stored up in one while being utilized in the other. In the Siemens regenerative reheating- or mill-furnace there are two pairs of chambers, each pair consisting of one larger and one smaller chamber, through one of which the air passes, and through the other the gas on its way to the furnace. The so-called "Poodard recuperator" is a form of regenerator in which, by an ingenious arrangement of solid and hollow fire-bricks, the current is made continuous in one direction, instead of requiring reversal as in the Siemens regenerative furnace. This form of furnace has been employed for reheating in rolling-mills.

3. In the old universities, a master or doctor who takes part in the regular duties of instruction or government. At Cambridge all resident masters of arts of less than four years' standing, and all doctors of less than two, are regents. At Oxford the period of regency is shorter. At both universities those of a more advanced standing, who keep their names on the college books, are called *non-regents*. At Cambridge the regents compose the upper house and the non-regents the lower house of the senate, or governing body. At Oxford the regents compose the congregation, which confers degrees and does the ordinary business of the university. The regents and non-regents collectively compose the convocation, which is the governing body in the last resort.

It is the largest permanent association of soldiers, and the third subdivision of an army-corps, several regiments constituting a brigade, and several brigades a division. These combinations are, however, temporary, while in the regiment the same officers serve continuously, and in command of the same bodies of men. The strength of a regiment may vary greatly, as any regiment may comprise any number of battalions. The organization of the British Royal Artillery is anomalous, the whole body forming one regiment. In 1890 it consists of about 33,000 officers and men, distributed in a number of brigades, each of which is as large as an ordinary regiment. In the United States service the full strength of a cavalry regiment is now 821, and of infantry 821. Abbreviated *regt.*

7. In *zoögeog.*, a large faunal area variously limited by different authors. Especially—(a) A realm; by several primary divisions of the earth's surface, characterized by its fauna: as, the Palearctic or the Nearctic *region*. The term acquired specific application to certain large principal areas from its use in this sense by P. L. Sclater in 1857. Sclater's regions, adopted with little modification by Günther and Wallace, were six in number: the Palearctic, Ethiopian, Oriental or Indian, Australian, Nearctic, and Neotropical. (See these words.) Baird added a seventh, the West Indian, now considered a division of the Neotropical. In 1874 Sclater, following Huxley, recognized as primary divisions (1) *Arctogæa*, comprising the Palearctic, Ethiopian, Indian, and Nearctic regions; (2) *Dendrogaæa*, represented by the Neotropical regions; (3) *Antarctogæa*, with an Australasian region; and (4) *Ornithogæa*, with a New Zealand region. (b) A secondary faunal area, the primary being called a *realm*: as, the Antillean, Central American, and Brazilian *regions* of the American Tropical realm. In this sense it has been used by most American zoologists. Various other divisions have been proposed, as by A. Murray in 1866, Huxley in 1868, W. T. Blanford in 1869, E. Blyth in 1871, A. Newton in 1875, T. Gill in 1878, and J. A. Allen in 1878. Each of the main divisions, however defined by different naturalists, is subdivided into several subregions or provinces, more or less minutely in different systems. Thus, for example, the Ethiopian region is divided by Newton into the Libyan, Guinean, Caffrarian, Mozambican, and Madagascarian subregions, and the Libyan subregion itself into the Arabian, Egyptian, Abyssinian, and Gambian provinces. The waters of the globe have been either included in the prime divisions based on the land faunas, or segregated in peculiar ones.—*Abdominal regions*. The vocal registers are distinguished by quality more than by pitch, since the same tone can often be produced in more than one register. The difference lies in the way in which the larynx is used, but the exact nature of the process is disputed. The so-called *head-register* and *chest-register* include tones that call the cavities of the head and chest respectively into decided sympathetic vibration. The different vocal qualities are also called the *low*, *middle*, and *high registers*, or the *thick*, *middle*, and *thin registers*, depending in the first case upon the pitch of the tones for which they are best suited, and in the second upon the supposed condition of the vocal cords in producing them, or the quality of the tones produced.

By leaving the throttle-valve fully open and closing the induction-valve earlier or later in the stroke, the steam arrives in the cylinder nearly at full pressure, and with its full store of available heat for conversion into work by expansion. (3) An arrangement of weights, springs, and an eccentric or eccentrics, carried on the fly-wheel shaft or on the fly-wheel of a steam-engine, connected with the stem of the induction-valve by an eccentric-rod, and automatically varying

a, fly-wheel shaft; *b*, *b'*, and *a*, *a'*, eccentrics in different positions of the eccentrics *c* and *d*. The eccentric *c* turns freely on the shaft *a*, and is actuated by links *e*, that are pivoted to ears formed on the eccentric, and are also pivoted to weights *f*. The weights have the form of curved bars, and are pivoted at one end to spokes of the wheel, as shown at *g*. The eccentric *d* is fitted to and turns freely upon the perimeter of the eccentric *c*. It is also connected by a link *h* to the toe of one of the weights, and is rotated on *c* by the motion of the weight toward or away from the center of the shaft *a*. The eccentric *c* is also rotated on the shaft *a* by the motion of the weights to or from the center of the shaft, but it is turned in a direction opposite to that in which *d* is turned. These two eccentrics, therefore, constitute a compound eccentric, the eccentricity or "throw" of which varies with the position of the weights, while the "lead" remains practically the same. Coiled springs *i* constantly press the weights *f* toward the center, and the action of these springs is more or less overcome by centrifugal force as the shaft *a* rotates with greater or less velocity. The higher the velocity the less will be the throw of the valve and the shorter the cut-off, and vice versa. Fig. 1 shows the weights in their extreme outward position, in which the throw *ab* is the least possible. Fig. 2 shows the extreme inward position of the weights, in which the throw *ab* is the greatest possible. The range of variable cut-off is thus carried from simple lead to 0.7 of the stroke, and a very small percentage of change in the velocity is sufficient to change the cut-off from its least to its greatest limit.

the cut-off, maintaining a uniform speed of rotation under conditions of widely varying work. One of the most ingenious and scientific of this class is illustrated in the cut with an accompanying explanation. (4) A throttle-valve. (5) The induction-valve of a steam-engine. (6) The brake-band of a crab or crane which regulates the descent of a body raised by or suspended on a machine. (*b*) In heating apparatus: (1) A register. (2) A thermostat. (3) An automatic draft-damper for the furnace or fire-box of a steam-boiler. Also called *damper-regulator*. (*c*) In *horol.*: (1) A clock of superior order, by comparison with which other time-pieces are regulated. (2) A clock which, being electrically connected with other clocks at a distance, causes them to keep time in unison with it. (3) A device (commonly a screw and small nut) by which the bob of a pendulum is raised or lowered, causing the clock to go faster or slower. (4) The fly of the striking mechanism of a clock. (See *fly*, 3 (*a*), (1).) (5) A small lever which shortens or lengthens the hair-spring of a watch, thus causing the watch to go faster or slower according as the regulator is moved toward a part marked *F*, or *S*. (*d*) In the electric light, the contrivance, usually an electromagnet, by which the carbon-points are kept at a constant distance, so that the light is steady (see *electric light, under electric*); or, in general, a contrivance for making the current produced by the dynamo-machines of constant strength.—**Many-light regulator**, a regulator for voltaic arc-lights, controlling numerous lights on one circuit.—**Regulator-box**. (*a*) A valve-chest or -box. (*b*) The original valve-motion of Watt's double-action condensing pumping-engine. It was a valve-box having a spindle through one of its sides, on which was a toothed sector working on a central bearing, and meshing with a rack attached to a valve. A tripping-lever attached to the sector and operated by the plug-tree caused the oscillations of the latter to open and close the valve.—**Regulator-cock**, one of the oil-cocks which admit oil to the steam-chest or valve-chest of a locomotive engine.—**Regulator-cover**, the cover or bonnet of a valve-chest or steam-chest of a steam-engine cylinder.—**Regulator-shaft and -levers**, in locomotive engines, the shaft and levers placed in front of the smoke-box when each cylinder has a separate regulator: now collectively

called *valve-gear* or *valve-motion*.—**Regulator-valve**, a throttle-valve.

apparatus for extraction of sugar from beet-roots or from sugar-canes, reheaters are arranged in alternation with diffusers, commonly twelve in number, containing the sliced roots. The hot water for diffusion is directed through pipes connecting the diffusers with the reheaters by means of cocks or valves, and is reheated by passing through a reheater after passing through a diffuser. Thus, through the aid of heat and pressure, the water becomes charged with sugar. See *diffusion apparatus* (under *diffusion*), and *diffuse*.

A deer of the genus *Rangifer* or *Tarandus*, having horns in both sexes, and inhabiting arctic and cold temperate regions; the *Cervus tarandus*, *Rangifer tarandus*, or *Tarandus rangifer*.

Reindeer *Rangifer tarandus*

It has branched, recurved, round antlers, the crowns of which are more or less palmated, the antlers of the male are much larger than those of the female, and are remarkable for the size and asymmetry of the brow-antler. The body is of a thick and square form, and the legs are shorter in proportion than those of the red-deer. The size varies much according to climate; about 4 feet 6 inches may be given as the average height of a full-grown specimen. The reindeer is keen of sight and swift of foot, being capable of maintaining a speed of 9 or 10 miles an hour for a long time, and can easily draw a weight of 200 pounds, besides the sledge to which it is usually attached when used as a beast of draft. Among the Laplanders the reindeer is a substitute for the horse, the cow, and the sheep, as it furnishes food, clothing, and the means of conveyance. The caribou of North America, if not absolutely identical with the reindeer, would seem to be at least a well-marked variety, usually called *R. caribou*. The American barren-ground reindeer has been described as a different species, *R. groenlandicus*. See also *caribou*.

ferred to a reciprocal correlate.

relatedness (rē-lāt'ed-nes), *n.* The state or
condition of being related; affinity.

We are not strong by our power to penetrate, but by our
relatedness. The world is enlarged for us, not by new ob-
jects, but by finding more affinities and potencies in those
we have. *Emerson*, Success.

who relates, recites, or narrates; a historian.

late: see *refer*, *relate*.] 1. The act of relating
or telling; recital; narration.

Relations are so much indebted.

reliques of something true. *Milton*, Hist. Eng., l.

Political and military *relations* are for the greater part
accounts of the ambition and violence of mankind.
Burke, Abridg. of Eng. Hist.

3. A character of a plurality of things; a fact
concerning two or more things, especially and
more properly when it is regarded as a predi-
cate of one of the things connecting it with the
others; the condition of being such and such
with regard to something else: as, the *relation*
of a citizen to the state; the *relation* of demand
and supply. Thus, suppose a locomotive blows off
steam; this fact constitutes a relation between the loco-
motive and the steam so far as the "blowing" is conceived
to be a character of the locomotive, and another relation
so far as the "being blown" is conceived as a character of
the steam, and both these relations together are embraced
in the same relationship, or plural fact. This latter, also
often called a *relation*, is by logicians called the *founda-*
tion of the relation. The two or more subjects or things
to which the plural fact relates are termed the *relates* or
correlates; the one which is conceived as subject is spe-
cifically termed the *subject* of the relation, or the *relate*;
the others the *correlates*. Words naming things in their
character as relates are called *relatives*, as father, cousin.

A set of relatives referring to the same relationship ac-
cording as one or another object is taken as the relate are
called *correlatives*: such are buyer, seller, commodity,
price. The logical nomenclature of relations depends on
the consideration of *individual relations*, or relations sub-
sisting between the individuals of a single set of cor-
relates, as opposed to *general relations*, which, really or in
conception, subsist between many such sets. Relations are
either *dual*—that is, connecting couples of objects, as in
the examples above—or *plural*—that is, connecting more
than two correlates, as the relation of a buyer to the
seller, the thing bought, and the price. Every individual
dual relation is either a relation of a thing to itself or a
relation of a thing to something else. *Logical relations* are
those which are known from logical reflection; opposed
to *real relations*, which are known by generalization and
abstraction from ordinary observations. The chief logi-
cal relations are those of *impossibility*, *coexistence*,
identity, and *otherness*. Real dual relations are of five
classes: (1) *differences* or *discrepancies*, being relations
which nothing can bear to itself, as being greater than;
(2) *subi-relations* or *concurrents*, being relations which
nothing can bear to anything else, as self-consciousness;
(3) *agreements*, or relations which everything bears to it-
self, as similarity; (4) relations which everything bears
to everything else, which may be called *distances*; and
(5) *various relations*, which some things only bear
to themselves, and which subsist between some pairs of
things only. Other divisions of relations are important in
logic, as the following. An *iterative* or *repeating relation*
is such that a thing may at once be in that relation and
its converse to the same or different things, as the relation
of father to son, or spouse to spouse: opposed to a *final*
or *non-repeating relation*, as that of husband to wife. An
equiparance or *convertible relation*, opposed to a *dispropor-*
tionance or *inconconvertible relation*, is such that, if anything
is in that relation to another, the latter is in the same re-
lation to the former, as that of cousins. A relation which
cannot subsist between two things reciprocally, as that of
greater and less, may be called an *irreciprocal relation*,
opposed to a *reciprocal relation*, which admits reciproc-
ation as possible merely. A relation such that if A is so
related to B, and B so related to C, then A is so related to
C, is called a *transitive*, in opposition to an *intransitive re-*
lation. A relation such that if A is so related to some-
thing else, C, there is a third thing, B, which is so related
to C, and to which A is so related, is called a *concatenated*,
in opposition to an *inconcatenated relation*. A relation
subsisting between objects in an endless or self-returning
series is called an *interhaustible*, in opposition to an *ex-*
haustible relation. If there is a self-returning series, the
relation is termed *cyclic*, in opposition to *acyclic*. A transi-
tive relation such that of any two objects of a certain cate-
gory one has this relation to the other may be called a
linear relation or *line* of the relation. According as this is
continuous or discontinuous, finite or infinite, and in the
latter case discretely or absolutely, these designations
may be applied to the relation. According to the nomi-
nalistic (including the conceptualistic) view, a relation is
a mere product of the mind. Adding to this doctrine that
of the relativity of knowledge, that we know only relations,
Kant reached his conclusion that things in themselves are
absolutely inconceivable. But most Kantian students come
to deny the existence of things in themselves, and so reach
an idealistic realism which holds relations to be as real as
any facts. The realistic view is expressed in the dictum
of Scotus that every relation without which, or a term of
which, its foundation cannot be is, in the thing (*realiter*),
identical with that foundation—that is, what really is is

5. In *music*, having a close melodic or harmonic relation. Thus, *relative chords*, in a narrow sense, the triads of a given key (tonality) having as roots the successive tones of its scale; *relative keys*, keys (tonalities) having several tones in common, thus affording opportunity for easy modulation back and forth, or, more narrowly, keys whose tonic triads are relative chords of each other; *relative major*, *relative minor*, a major key and the minor key of its submediant regarded with respect to each other. Also *related*, *parallel*. See *cut under chord*, 4.—**Relative beauty**, beauty consisting in the adaptation of the object to its end.—**Relative chronology**, in *geol.*, of the geological method of computing time, as opposed to the *absolute* or *historical* method.—**Relative end**, *ens*, *equilibrium*. See the nouns.—**Relative enunciation**, an enunciation whose clauses are connected by a relative: as, "Wherever the carcass is, there will the eagles be gathered together."—**Relative gravity**. (a) The acceleration of gravity at a station referred to that at another station, and not expressed in terms of space and time. (b) Same as *specific gravity* (which see, under *gravity*).—**Relative ground of proof**, a premise which itself requires proof.—**Relative humidity**, *hypermotopia*, *locality*. See the nouns.—**Relative motion**. See *motion*.—**Relative opposites**, the two terms of any dual relation.—**Relative place**, the place of one object as defined by the situations of other objects.—**Relative pleasure or pain**, a state of feeling which is pleasurable or painful by force of contrast with the state which preceded it.—**Relative pronoun**, *proposition*, etc. See the nouns.—**Relative syllogism**, a syllogism whose major premise is a relative enunciation: as, Where Christ is, there will also the faithful be; but Christ is in heaven; therefore there also will the faithful be.—**Relative term**, a term which, to become the complete name of any class, requires to be completed by the annexation of another name, generally of another class: such terms are, for example, father of, the qualities of, tangent to, identical with, man that is, etc. Strictly speaking, all adjectives are of this nature.—**Relative time**, the sensible measure of any part of duration by means of motion.

II. n. 1. Something considered in its relation to something else; one of two things having a certain relation.—2. A person connected by blood or affinity; especially, one allied by blood; a kinsman or kinswoman; a relation.

See *prime*, 7.

relativeness (rel'g-tiv-ness), *n.* The state of being relative or having relation.

Therefore, while for a later period of the dialect-life of Hellas the expression "dialect" is one of peculiar *relativeness*, it is a justifiable term for certain aggregations of morphological and syntactical phenomena in the earlier periods of language, when dialect-relations were more sharply defined.

Amer. Jour. Philol., VII. 444.

relativity (rel-a-tiv'i-ty), *n.* [= *F.* *relativité*, < *NL.* **relativitas* (-t-), < *LL.* *relativus*, relative: see *relative*.] 1. The character of being relative; relativeness; the being of an object as it is by force of something to which it is relative. Specifically—2. Phenomenality; existence as an immediate object of the understanding or of experience; existence only in relation to a thinking mind.—**The doctrine of the relativity of existence**, the doctrine that the real existence of the subject, and also of the object, depends on the real relation between them.

—**The doctrine of the relativity of knowledge**. The phrase *relativity of knowledge* has received divergent significations. (a) The doctrine that it is impossible to have knowledge of anything except by means of its relations to the mind, direct and indirect, cognized as relations. (b) The doctrine of phenomenalism, that only appearances can be known, and that the relations of these appearances to external substrata, if such there be, are completely incognizable. This doctrine is sometimes associated with a denial of the possibility of any knowledge of relations as such, or at least of any whose terms are not independently present together in consciousness. It would therefore better be denominated *the doctrine of the impossibility of relativity of cognition*. (c) The doctrine that we can only become conscious of objects in their relations to one another. This doctrine is almost universally held by psychologists.

Relative and correlative are each thought through the other, so that in enouncing *relativity* as a condition of the thinkable—in other words, that thought is only of the thinkable—this is tantamount to saying that we think one thing only as we think two things mutually and at once; which again is equivalent to the doctrine that the absolute (the non-relative) is for us incognitable, and even inconceivable.

Sir W. Hamilton, *Metaph.*, App. V. (e).

When a philosopher lays great stress upon the *relativity* of our knowledge, it is necessary to cross-examine his writings, and compel them to disclose in which of its many degrees of meaning he understands the phrase. . . .

To most of those who hold it, the difference between the Ego and the Non-ego is not one of language only, nor a formal distinction between two aspects of the same reality, but denotes two realities, each having a separate existence, and neither dependent on the other. . . . They believe that there is a real universe of "things in themselves," and that whenever there is an impression on our senses, there is a "thing in itself," which is behind the phenomenon, and is the cause of it. But as to what this thing is "in itself," we, having no organs except our senses for communicating with it, can only know what our senses tell us; and as they tell us nothing but the impression which the thing makes upon us, we do not know what it is in itself at all. . . . Of the ultimate realities, as such, we know the existence, and nothing more. . . . It is in this form that the doctrine of the relativity of knowledge is held by the greater number of those who profess to hold it, attaching any definite idea to the term.

reliable (rê-li-ā-bl), *a.* [*rely¹* + *-able*.] That may be relied on; fit or worthy to be relied on; worthy of reliance; to be depended on; trustworthy. [This word, which involves a use of the suffix *-able* superficially different from its more familiar use in *provable*, 'that may be proved,' *eatable*, 'that may be eaten,' etc., has been much objected to by purists on philological grounds. The objection, however, really has no philological justification, being based on an imperfect knowledge of the history and uses of the suffix *-able*, or on a too narrow view of its office. Compare *available*, *conversible*, *dispensable*, *laughable*, and many other examples collected by Fitzedward Hall in his work cited below, and see *-able*. As a matter of usage, however, the word is shunned by many fastidious writers.]

George Eliot, Adam Bede, lii.

relic (rel'-ik), *n.* [Formerly also *relic, relique*; < *ME. relike, relike*, chiefly pl., < *OF. reliques*, pl., *F. relique*, pl. *reliques* = *Pr. reliquias* = *Sp. Pg. It. reliquia* = *AS. reliquias*, relics (also in comp. *relic-gong*, a going to visit relics), < *L. reliquā*, remains, relics, < *relinquere* (pret. *reliquit*, pp. *relictus*), leave behind: see *relinquish*. Cf. *relict*.] 1. That which remains; that which is left after the consumption, loss, or decay of the rest.

3. That which is preserved in remembrance; a memento; a souvenir; a keepsake.

4. An object held in reverence or affection because connected with some sacred or beloved person deceased; specifically, in the *Rom. Cath. Ch.*, the *Gr. Ch.*, and some other churches, a saint's body or part of it, or an object supposed to have been connected with the life or body of Christ, of the Virgin Mary, or of some saint or martyr, and regarded therefore as a personal memorial worthy of religious veneration. Relics are of three classes: (a) the entire bodies or parts of the bodies of venerated persons, (b) objects used by them or connected with their martyrdom, and (c) objects connected with their tombs or sanctified by contact with their bodies. Relics are preserved in churches, convents, etc., to which pilgrimages are on their account frequently made. The miraculous virtues which are attributed to them are defended by such instances from Scripture as that of the miracles which were wrought by the bones of Elisha (2 Ki. xiii. 21).

=*Syn.* 4. *Remains, Relics.* The *relics* of a dead person are his corpse or his literary works; in the latter case they are, for the sake of distinction, generally called *literary remains*. We speak also of the *relics* of a feast, of a city, building, monument, etc. *Relics* always suggests antiquity: as, the *relics* of ancient sovereigns, heroes, and especially saints. The singular of *relics* is used; that of *relics* is not.

relic-knife (rel'-ik-nif), *n.* A knife made so as to contain the relic or supposed relic of a saint, either in a small cavity provided for the purpose in the handle, or by incorporating the relic, if a piece of bone or the like, in the decoration of the handle itself. *Jour. Hollow relief or bas-relief sculpture. — Court of Balto, Egypt; Paleozoic age, 2d century B. C.

8. In *her*, the supposed projection of a charge from the surface of the field, represented by shading with a heavier bounding-line on the sinister side and toward the base than on the dexter side and toward the chief. Thus, if an escutcheon is divided into seven vertical stripes, alternately red and white, it would not be blazoned pale of seven gules and argent, as the rule is that pale is always of an even number, but the sinister side of three alternate stripes would be shaded to indicate relief, and the blazoning would be gules, three pallets argent, the assumption being that the pallets are in relief upon the field.

9. In *phys. geog.*, the form of the surface of any part of the earth, considered in the most general way, and with special regard to differences of elevation; little used except in the name *relief-map*, by which is meant a geographical or geological map in which the form of the surface is expressed by elevations and depressions of the material used. Unless the scale of such relief-maps is very large, there must be considerable exaggeration, because differences of vertical elevations in nature are small as compared with superficial extent. Relief-maps are occasionally made by preparing a model of the region it is desired to exhibit, and then photographing this model under an oblique illumination. The relief of the surface is also frequently indicated on maps by various colors or by a number of tints of one color. Both hachure and contour-line maps also indicate the relief of the surface, to a greater or less extent, according to their scale and artistic perfection. Thus, the Dufour map of Switzerland, especially when photographed down to a small size, has in a very striking degree the effect of a photograph from an actual model, although in reality a hachure-map.

10. In *fort.*, the perpendicular height of the interior crest of the parapet above the bottom of the ditch.—11. Prominence or distinctness given to anything by something presenting a contrast to it, or brought into close relation with or proximity to it; a contrast.

Here also grateful mixture of well-matched
And sorted hues (each giving each relief,
And by contrasted beauty shining more).

Cooper, *Task*, III. 634.

Miss Brooke had that kind of beauty which seems to be thrown into relief by poor dress.

George Eliot, *Middlemarch*, i.

12. In *hunting*, a note sounded on the horn on reaching home after the chase.

Now, Sir, when you come to your stately gate, as you sounded the recheat before, so now you must sound the *reliefe* three times. *Return from Parnassus* (1606), II. 5.

13. What is picked up; fragments left; broken meat given in alms.

After dinner, they shall come all fire sowers, and take the *relief* of the mete and drynke that the forsayde M. and shopholders levyth. *English Gilds* (E. E. T. S.), p. 315.

14. In *law*, that which a court of justice awards to a suitor as redress for the grievance of which he complains.—15. In *feudal law*, a fine or composition which the heir of a tenant holding by knight's service or other tenure paid to the lord at the death of the ancestor, for the privilege of succeeding to the estate, which, on strict feudal principles, had lapsed or fallen to the lord on the death of the tenant. This relief consisted of horses, arms, money, etc., the amount of which was originally arbitrary, but afterward fixed by law. The term is still used in this sense in Scots law, being a sum exigible by a feudal superior from the heir who enters on a feu. Also called *casualty of relief*.

On taking up the inheritance of lands, a *relief* [was paid to the king]. The *relief* originally consisted of arms, armor and horses, and was arbitrary in amount, but was subsequently "ascertained," that is, rendered certain, by the superior, and fixed at a certain quantity of arms and habiliments of war. After the assize of arms of Henry II., it was commuted for a money payment of 100s. for every knight's fee, and as thus fixed continued to be payable ever afterwards. *S. Dorell*, *Tuxes in England*, I. 25.

Absolute relief, in *fort.*, the height of any point of a work above the bottom of the ditch.—Alternative relief, in *law*, different modes of redress asked in the alternative, usually because of uncertainty as to some of the facts, or because of a discretionary power in the court to award either.—Bond of relief. See *bond*.—Constructive relief, in *fort.*, the height of any point of a work above the plane of construction.—Conversion of relief. See *conversion*.—Indoor relief, accommodation in the poor-house, as distinguished from outdoor relief, the assistance given to those paupers who live outside. [Great Britain.]—Infestment of relief. See *infestment*.—Outdoor relief. See *indoor relief*.—Parochial relief. See *parochial*.—Relief Church, a body of Presbyterian dissenters in Scotland, who separated from the Established Church on account of the oppressive exercise of patronage. Thomas Gillespie, its founder, was deposed by the General Assembly of the Church of Scotland in 1752, and organized the "Presbytery of Relief" on October 22d, 1761. In 1847 the Relief and United Secession churches amalgamated, forming the United Presbyterian Church.—Relief law. See *law*.—Relief processes, those processes in mechanical or "process" engraving by which are produced plates or blocks with raised lines, capable of being printed from like type, or together with type, in an ordinary press.—Relief satiné, or satiné relief. Same as *raised satin-stitch* (which see, under *satin-stitch*).—Roman Catholic Relief Acts. See *Catholic*.—Specific relief, in *law*, action of the court directly on the person or property, as distinguished from that in which an award of damages only is made, to be collected by execution.—Syn. 1. relief-perspective (rē-lēf'pēr-spek'tiv), *n.*

The art of constructing homological figures in space, and of determining the relations of the parts of bas-reliefs, theatrical settings, etc., to make them look like nature. Every such representation refers to a fixed center of perspective and to a fixed plane of homology. The latter in a theater setting is the plane in which the actors generally stand; in a bas-relief it is the plane of life-size figures. Every natural plane is represented by a plane cutting it in a line lying in the plane of homology. Every natural point is represented by a point in the same ray from the center of perspective. The plane of homology represents itself, and the center of perspective represents itself. One other point can be taken arbitrarily to represent a given point. There is a vanishing plane, parallel to the plane of homology, which represents the portions of space at an infinite distance.

relief-valve (rē-lēf'valv), *n.* 1. In a steam-engine, a valve through which the water escapes into the hot-well when shut off from the boiler.—2. A valve set to open at a given pressure of steam, air, or water; a safety-valve.—3. A valve for automatically admitting air to a cask when the liquid in it is withdrawn.

relief-work (rē-lēf'wērk), *n.* Work in road-making, the construction of public buildings, or the like, put in hand for the purpose of affording employment to the poor in times of public distress. [Eng.]

Those . . . who believe that any employment given by the guardians on relief-works would be wasteful and injurious may find that the entire question is one of administration, and that such work proved a success in Manchester during the cotton famine. *Contemporary Rev.*, LIII. 51.

High Relief.—The Rondenini mask of Medusa in the Egyptian Museum, Rome, showing the type of the Gorgon.

the figures project at least one half of their natural circumference from the background. In *low relief* the figures project but slightly from the ground, in such a manner that no part of them is entirely detached from it, as in medals, the chief effect being produced by the treatment of light and shadow. Middle or half relief is intermediate between the other two. The varieties of relief are still further distinguished as *diacinto rilievo*, or very flat relief, the lowest possible relief of which the projection in parts hardly exceeds the thickness of a sheet of paper; and *cavo-rilievo*, hollow relief, also called *intaglio rilievo*, or *cavato-rilievo*, a sculpture, an Egyptian form of relief obtained by cutting a furrow with sloping sides around a figure previously outlined on a stone surface, leaving the highest parts of the finished work on a level with the original surface-plane. See also *ent* in next column, and *cava* under *orant*, *Proserpine*, *alto-rilievo*, and *bas-relief*.

5. To release from a post, station, task, or duty by substituting another person or party; put another in the place of, or take the place of, in the performance of any duty, the bearing of any burden, or the like: as, to *relieve* a sentinel or guard.

See *experience*.—**To get religion**. See *get*, 1.—**Syn. 1. Religion, Devotion, Piety, Sanctity, Saintliness, Godliness, Holiness, Religiosity**. In the subjective aspect of these words religion is the most general, as it may be also the most formal or external; in this sense it is the place of the will and character of God in the heart, so that they are the principal object of regard and the controlling influence. Devotion and piety have most of fervor. Devotion is a religion that consecrates itself, being both a close attention to God with complete inward subjection and an equal attention to the duties of religion. Piety is religion under the aspect of filial feeling and conduct, the former being the primary idea. Sanctity is generally used objectively; subjectively it is the same as holiness. Saintliness is more concrete than sanctity, more distinctly a quality of a person, likeness to a saint, ripeness for heaven. Godliness is higher than saintliness; it is likeness to God, or the endeavor to attain such likeness, fixed attention given immediately to God, especially obedience to his will and endeavor to copy his character. Holiness is the most absolute of these words; it is moral and religious wholeness, completeness, or something approaching so near to absolute freedom from sin as to make the word appropriate; it includes not only being free from sin, but refusing it and hating it for its own sake. Religiosity is not a very common nor a very euphonious word, but seems to meet a felt want by expressing a susceptibility to the sentiments of religion, awe, reverence, admiration for the teachings of religion, etc., without much disposition to obey its commands.

Thomson, Castle of Indolence, I. 57.

4. In *line-engraving* and *etching*: (a) A distinguishing mark or peculiarity of any kind, indicating any particular state of the plate prior to its completion. The remark may be a slight sketch made by the engraver on the margin of his plate, or it may consist merely in the absence of certain detail or features of the finished work. Thus, in a first proof of an etching the absence of retouching with the dry point, or of a final rebiting, constitutes a remark; or in a line-engraving it may consist in the presence or absence of some minor ob-

ject, or of certain lines representing texture or shading, which in a later state of the plate are removed or added.

The old legend still lingers that the *remarque* began when some unknown etcher tried his point upon the edge of his plate just before taking his first impressions. The belief yet obtains that the *remarque* testifies to the etcher's supreme satisfaction with a supreme effort. But as a matter of fact the *remarque* has become any kind of a fanciful supplementary sketch, not necessarily appropriate, not always done by the etcher, and appearing upon a number of impressions which seem to be limited only at the will of artist or dealer. Sometimes we see 50 *remarque* proofs announced, and again 300.

New York Tribune, Feb. 6, 1887.

(b) A print or proof bearing or characterized by a remark; a remarked proof, or remark proof. Also written *remarque*. = *Syn.* 2. *Remark*, *Observation*, *Comment*, *Commentary*, *Reflection*, *Note*, *Annotation*, *Gloss*. A remark is brief and cursory, suggested by present circumstances and presumably without previous thought. An observation is made with some thought and care. A comment is a remark or observation bearing closely upon some situation of facts, some previous utterance, or some published work. Remark may be substituted by modesty for observation. When printed, remarks, observations, or comments may be called reflections: as, Burke's "Reflections on the Revolution in France"; when they are systematic in explanation of a work, they may be called a commentary: as, Lange's "Commentary on Matthew." A note is primarily a brief writing to help the memory; then a marginal comment: notes is sometimes used modestly for commentary: as, Barnes's "Notes on the Psalms"; Trench's "Notes on the Parables." A marginal comment is more definitely expressed by annotation. A gloss is a comment made for the purpose of explanation, especially upon a word or passage in a foreign language or a peculiar dialect.

renaissance (rēnā'ssāns' or rēnā'ssāns), *n.* and *a.* [F. *renaissance*, OF. *renaissance*, *renaissance*, < ML. *renascētia*, new birth; see *renaissance*.] 1. *n.* A new birth; hence, the revival of anything which has long been in decay or desuetude.

Specifically [*cap.*], the movement of transition in Europe from the medieval to the modern world, and especially the time spirit, and activity of the revival of classical art and letters. The earliest traces and most characteristic development of this revival were in Italy, where Petrarch and the early humanists and artists of the fourteenth century may be regarded as its precursors. The movement was greatly stimulated by the influx of Byzantine scholars, who brought the literature of ancient Greece into Italy in the fifteenth century, especially after the taking of Constantinople by the Turks in 1453. The Italian Renaissance was at its height at the end of the fifteenth and in the early sixteenth century, as seen in the lives and works of such men as Lorenzo dei Medici, Michelangelo, Leonardo da Vinci, Raphael, Machiavelli, Boccaccio, Ariosto, Correggio, Titian, and Aldus Manutius. The Renaissance was aided everywhere by the spirit of discovery and exploration of the fifteenth century — the age which saw the invention of printing, the discovery of America, and the rounding of Africa. In Germany the Renaissance advanced about the same time with the Reformation (which commenced in 1517). To England the revival of learning was fostered by Erasmus, Colet, Grocyn, More, and their fellows, about 1500, and in France there was a brilliant artistic and literary development under Louis XII. (1498-1515) and Francis I. (1515-47). Also, in English form, *renaissance*.

I have ventured to give to the foreign word *renaissance* — destined to become of more common use amongst us — as the movement which it denotes comes, as it will come, increasingly to interest us — an English form [*Re-nascence*].
M. Arnold, Culture and Anarchy, iv, note.

The Renaissance and the Reformation mark the return to experience. They showed that the doctrine of reconciliation was at last passing from the abstract to the concrete.
E. Caird, Philos. of Kant, p. 28.

II. *a.* [*cap.*] Of or pertaining to the Renaissance; in the style of the Renaissance. — *Renaissance architecture*, the style of building and decoration which succeeded the medieval, and was based upon study and emulation of the outward forms and ornaments of Roman art, though with imperfect understanding of their principles. This style had its origin in Italy in the first half of the fifteenth century, and afterward spread over Europe. Its main characteristic is an attempted return to the classical forms which had been the forerunners of the Byzantine and the medieval. The Florentine Brunelleschi (died about 1446) was one of the first masters of the style, having prepared himself by earnest study of the remains of the monuments of ancient Rome. From Florence the style was introduced into Rome, where the works of Bramante (died 1514) are among its finest examples, the chief of these being the palace of the Chancery, the foundations of St. Peter's, part of the Vatican, and the small church of San Pietro in Montorio. One of the greatest achievements of the Renaissance is the dome of St. Peter's, the work of Michelangelo; but this must yield in grandeur of conception to the earlier Florentine dome of Brunelleschi. After Michelangelo the style declined rapidly. Another chief Renaissance school arose in Venice, where in the majority of the buildings of the sixteenth and seventeenth centuries predominance is given to external decoration. From this school sprang Palladio (1518-1580), whose distinctive style of architecture received the name of *Palladian*. Renaissance architecture was introduced into France by Lombardic and Florentine architects at the beginning of the sixteenth century, and flourished there during that century, but especially in the first half, under Louis XII. and Francis I.

During the seventeenth century the style degenerated in France, as it had in Italy, and gave rise to the baroque and rococo productions of the so-called *rococo* or Louis XV. style of the first half of the eighteenth century.

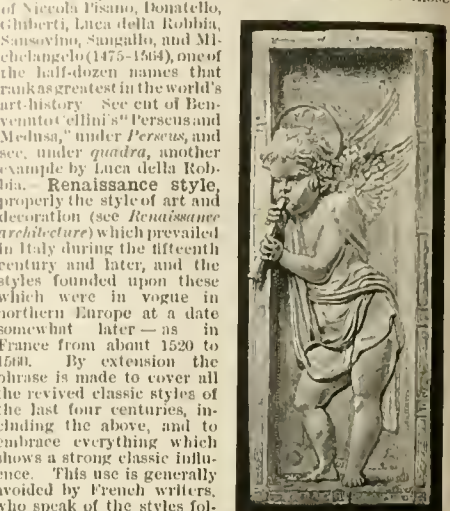

Renaissance Architecture. — French Renaissance tomb of Loys de Brézé (died 1510), Grand Seneschal of Normandy, etc., in the cathedral of Rouen; erected by his wife, Diane de Poitiers, and attributed to Jean Goujon and Jean Cousin.

In England the Renaissance style was introduced later than in France, and it is represented there by the works of Inigo Jones, Sir Christopher Wren, and their contemporaries — St. Paul's, London, being a grand example by Wren. While all Renaissance architecture is far inferior to medieval building of the best time, it represents a distinct advance over the debased and over-elaborated forms of the medieval decadence. For an Italian example, see *ut* under *Italian*; see also *ut* under *loggia* and *Palladian*. — *Renaissance braid-work*, a kind of needlework similar in its make to needle-point lace, but of much stouter material, as fine braid. — *Renaissance lace*, same as *renaissance braid-work*. — *Renaissance painting*, next to architecture the chief art of the Renaissance, had by far its most important and characteristic development in Italy, where, based upon the art of the Byzantine painters of the middle ages, a number of important art-centers or schools arose, differing from one another in their ideals and methods, but all distinctively Italian. The central one of these schools was that of Florence, which took the lead under the impulse and example of the great artist Giotto in the early part of the fourteenth century. Among the greatest of those after Giotto, whose genius influenced the development of the art, were Fra Angelico (Fra Giovanni da Fiesole), Masolino, Masaccio, Filippo Lippi, Sandro Botticelli, Filippino Lippi, and Leonardo da Vinci. The chief glory of Renaissance painting is that it advanced that art beyond any point that it had attained before, or has since reached. For other schools of Renaissance painting, see *Bolognese*, *Roman*, *Siennese*, *Umbrian*, *Venetian*; and see *Italian painting*, under *Italian*. — *Renaissance sculpture*, the sculpture of the Renaissance, characterized primarily by seeking its models and

inspiration in the works of Roman antiquity, instead of in contemporary life, like medieval sculpture. As an adjunct to architecture, this sculpture reached its highest excellence in Italy and in France. Eminent names are those of Nicola Pisano, Donatello, Ghiberti, Luca della Robbia, Sansovino, Sangallo, and Michelangelo (1475-1564), one of the half-dozen names that rank as greatest in the world's art-history. See *ut* under *Benvenuto Cellini's* *Perseus* and *Medusa*, under *Perseus*, and see, under *quadra*, another example by Luca della Robbia. — *Renaissance style*, properly the style of art and decoration (see *Renaissance architecture*) which prevailed in Italy during the fifteenth century and later, and the styles founded upon these which were in vogue in northern Europe at a date somewhat later — as in France from about 1520 to 1580. By extension the phrase is made to cover all the revived classic styles of the last four centuries, including the above, and to embrace everything which shows a strong classic influence. This use is generally avoided by French writers, who speak of the styles following the religious wars in France as the styles of Henry IV., Louis XIII., etc., excluding these from the Renaissance style proper; but English writers commonly include the whole period from 1400 to the French Revolution or the end of the eighteenth century, and divide it into various epochs or subordinate styles, according to the writer's fancy.

More broadly, *rip*, especially with *up*, stands for a cutting open or apart with a quick, deep stroke; as, to *rip up* a body or a sack of meal. *Rend* implies great force or violence. To *split* is primarily to divide lengthwise or by the grain; as, to *split wood*. *Clear* may be a more dignified word for *split*, or it may express a cutting apart by a straight, heavy stroke. *Fracture* may represent the next degree beyond cracking, the lightest kind of breaking, leaving the parts in place; as, a *fractured* bone or plate of glass; or it may be a more formal word for *break*. To *chop* is to cut apart with a heavy stroke, which is generally across the grain or natural cleavage, or through the narrow dimension of the material: *chopping* wood is thus distinguished from *splitting* wood.

rent, and **rent-seck**. *Rent-service* is when some corporal service is incident to it, as by fealty and a sum of money; *rent-charge*, or *fee-farm rent*, is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear (in other words, it is a charge on lands, etc., in the form of rent, in favor of one who is not the landlord); *rent-seck* is a like rent, but without any clause of distress. There are also *rents of assize*, certain established rents of freeholders and copyholders of manors, which cannot be varied: also called *quit-rents*. These, when payable in silver, are called *white rents*, in contradistinction to rents reserved in work or the baser metals, called *black rents* or *black mail*.

3. Also called *economic rent*.

Rent is that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil. It is often, however, confounded with the interest and profit of capital, and, in popular language, the term is applied to whatever is annually paid by a farmer to his landlord. *Ricardo*, *Pol. Econ.*, ii.

The *rent*, therefore, which any land will yield, is the excess of its produce beyond what would be returned to the same capital if employed on the worst land in cultivation. *J. S. Mill*, *Pol. Econ.*, II. xvi. § 3.

Rent is that portion of the regular net product of a piece of land which remains after deducting the wages of labor and the interest on the capital usual in the country incorporated into it.

W. Roscher, *Pol. Econ.* (trans.), II. § 149.

No part of *Ricardo's* theory is more elementary or more unchallenged than this, that the *rent* of land constitutes no part of the price of bread, and that high *rent* is not the cause of dear bread, but dear bread the cause of high *rent*. *Roe*, *Contemporary Socialism*, p. 428.

=*Syn.* *Repentance*, *Penitence*, *Contrition*, *Compunction*, *Regret*, *Remorse*, may express the sorrowful feeling of the wrong-doer in view of his conduct. *Regret* is quite as often used of wishing that one had not done that which is unwise; as applied to misconduct, it expresses the feeblest degree of sorrow for doing wrong; but it may contain no element of real *repentance*. *Repentance* goes beyond feeling to express distinct purposes of turning from sin to righteousness; the Bible word most often translated *repentance* means a change of mental and spiritual attitude toward sin. Strictly, *repentance* is the beginning of amendment of life; the word does not imply any greater degree of feeling than is necessary to bring about a change, whether the turning be from a particular sin or from an attitude of sin. *Penitence* implies a large measure of feeling, and applies more exclusively than *repentance* to wrong-doing as an offense against God and right. *Contrition*, literally breaking or bruising, is essentially the same as *penitence*; it is a deep, quiet, and continued sorrow, chiefly for specific acts. *Compunction*, literally pricking, is a sharp pang of regret or self-reproach, often momentary and not always resulting in moral benefit. It is more likely than remorse to result in good. *Remorse*, literally gnawing, is naturally sharper mental suffering than *compunction*; the word often suggests a sort of spiritual despair or hopelessness, paralyzing one for efforts to attain *repentance*.

repentant (rē-pen'tant), *a.* and *n.* [*< ME. repentant*, *< OF. repentant*, repentant, penitent, *< ML. repentin(-t)s*, ppr. of **repentere*, repent; see *repent*¹.] 1. *a.* 1. Experiencing repen-

For this purpose a bed of some resilient but soft material is provided to support the metal while in the chaser's hands: hollow silver vessels, for instance, are filled with pitch. The reform in representation he uniformly opposed.

He [Daniel Gookin] was the originator and the prophet of that immortal dogma of our national greatness—no taxation without representation.

M. C. Tyler, Amer. Lit., I, 154.

As for the principle of representation, that seems to have been an invention of the Teutonic mind; no statesman of antiquity, either in Greece or at Rome, seems to have conceived the idea of a city sending delegates armed with plenary powers to represent its interests in a general legislative assembly.

J. Fiske, Amer. Pol. Ideas, p. 59.

In these small [Grecian] commonwealths representation is unknown; whatever powers may be entrusted to individual magistrates or to smaller councils, the supreme authority must rest with an assembly in which every qualified citizen gives his vote in his own person.

E. A. Freeman, Amer. Lects., p. 246.

The representations of the people are most obviously susceptible of improvement.

See *egoistic*.

The representationists, as denying to consciousness the cognisance of aught beyond a merely subjective phenomenon, are likewise idealists; yet, as positing the reality of an external world, they must be distinguished as cosmæthetic idealists.

Hamilton, Reid's Works, Note C, § 1.

representative (rep-rē-zen-tā-tiv), *a.* and *n.* [*< F. représentatif = Pr. representativu = Sp. Pg. representativo = It. rappresentativo, < ML. representativus, < L. repræsentare, represent; see represent.*] **I.** *a.* 1. Representing, portraying, or typifying.

Representative [poesy] is as a visible history, and is an image of actions as if they were present, as history is of actions in nature as they are, (that is) past.

Bacon, Advancement of Learning, ii.

They relieve themselves with this distinction, and yet own the legal sacrifices, though representative, to be proper and real.

A. Hamilton, Federalist, No. 58.

3. Pertaining to or founded on representation of the people; conducted by the agency of delegates chosen by or representing the people: as, a *representative* government.

A representative government, even when entire, cannot possibly be the seat of sovereignty—the supreme and ultimate power of a State. The very term *representative* implies a superior in the individual or body represented.

$$\int_A^b f_a \cdot \phi(a, n) \cdot da,$$

where f_a is a function of limited variation between A and another limit, B , exceeding b , while $\phi(a, n)$ is (1) such a function of a and the parameter n that the integral of it between the same limits is less than an assignable finite quantity, whatever value between A and B be given to b , and whatever value be given to n ; and (2) is such that when n tends toward infinity, the integral of $\phi(a, n)$ from A to b , where b is greater than A and less than B , tends toward a constant finite value. This is called a *representative integral*, because it is equal to the function f_a multiplied by a constant.—**Representative knowledge**, knowledge of a thing by means of a mental image, but not as actually existing.—**Representative primogeniture**. See *primogeniture*.

II. *n.* 1. One who or that which represents another person or thing; that by which anything is represented or exhibited.

Then let us drink the Stewartry,
Kerroughtree's laird, and a' that,
Our *representative* to be.

Burns, Election Ballads, i.

The tribunes of Rome, who were the *representatives* of the people, prevailed, it is well known, in almost every contest with the senate for life.

A. Hamilton, Federalist, No. 63.

There are four essentials to the excellence of a *representative* system:—That the *representatives* . . . shall be *representatives* rather than mere delegates.

Bryce, Amer. Commonwealth, I, 296.

3. In *law*: (*a*) One who occupies another's place and succeeds to his beneficial rights in such a way that he may also in some degree be charged with his liabilities. Thus, an heir or devisee, since, to the extent of the property to which he succeeds, he is liable for his ancestor's debts, is a *representative* of the ancestor; but the widow, who takes part of the estate as dower, without liability, is not deemed a *representative* of the deceased; nor is an officer or trustee who succeeds to the rights and powers of the office or trust a *representative* of his predecessor, for, though he comes under liability in respect of the office or trust as his predecessor did, he does not succeed to the liabilities which his predecessor had incurred. The executor or administrator is sometimes spoken of as the *representative* of the decedent, but is usually distinguished by being called the *personal representative*. (*b*) One who takes under the Statute of Descents or the Statute of Distributions, or under a will or trust deed, a share which by the primary intention would have gone to his parent had the parent survived to the time for taking. If a gift has vested in interest absolutely in the parent, then, upon the parent's death before it vests in possession, the child will take as successor in interest of the parent, but not as *representative* of the parent in this sense. But if the parent dies before acquiring any interest whatever, as where one of several heirs apparent dies before the ancestor, leaving a child or children, the other heirs take their respective shares as if the one had not died, and the child or children of the deceased take the share their deceased parent would have taken. In this case all who share are *representatives* of the ancestor in sense (*a*), and the child or children are also *representatives* of the deceased heir apparent in sense (*b*). See *representation*, 7.

The Reproaches, in the Rom. Cath. Ch., antiphons sung on Good Friday during the Adoration of the Cross. They follow the special prayers which succeed the Gospel of the Passion, and consist of sentences addressed by Christ to his people, reminding them of the great things he had done for them, in delivering them from Egypt, etc., and their ungrateful return for his goodness, as shown in the details of the passion and crucifixion. They are intermingled with the Trisagion ("Holy God . . .") in Greek and Latin, and succeeded by hymns and the bringing in of the presanctified host in procession, after which the Mass of the Presanctified is celebrated. The Reproaches are sometimes sung in Anglican churches before the Three Hours Service. Also called *Improperia*. = *Syn. 1. The act of creeping or crawling on the belly, as a reptile does. *Oxen.*—2. In *math.*, the motion of one plane figure around another, so as constantly to be tangent to the latter while preserving parallelism between different positions of its own lines; especially, such a motion of one figure round another precisely like it so that the longest diameter of one shall come into line with the shortest of the other. This motion was applied by John Bernoulli in 1705 to the rectification of curves. Let AB be a curve whose length is required; let this be reversed about its normal, giving the curve ABC, and let this be reversed about the line between its extremities, giving the spindle-shaped figure ABCD; let DEFG be a similar and equal figure turned through a right angle—then, if the first has a reptatory motion about the second, its center will describe a four-humped or quadrifid figure OPQRSTU, with humps at P, R, T, V. Let this be placed in contact with a similar and equal figure so that a maximum and minimum diameter shall coincide, and receive a reptatory motion, then its center will describe an octogibbous or eight-humped figure. By a similar process, this will describe a sixteen-humped figure, etc. Each of these figures will have double the periphery of the preceding, and they will rapidly approximate toward circles. Hence, by finding the diameters of each, we approximate to the length of the original curve.

Reptilia¹ (rep-til'i-ä), *n. pl.* [NL., pl. of *L. reptile*, a reptile: see *reptile*.] In *zool.*: (a) In Linnaeus's system of classification (1766), the first order of the third class *Amphibia*, including turtles, lizards, and frogs. See *Amphibia*, 2 (a). [Disused.] (b) A class of cold-blooded oviparous or ovoviviparous vertebrate animals whose skin is covered with scales or scutes; the reptiles proper. There are two pairs or one pair of limbs, or none. The skull is monocondylic. The mandible articulates with the skull by a free or fixed quadrate bone. The heart has two auricles, generally not two completed ventricles; the ventricle gives rise to two arterial trunks, and the venous and arterial circulation are more or less mixed. Respiration is pulmonary, never branchial. No diaphragm is completed. There is a common cloaca of the digestive and urogenital systems, and usually two penes, sometimes one, seldom none. There are an amnion and an allantois. *Reptilia* thus defined were formerly associated with batrachians in a class *Amphibia*; but they are more nearly related to birds, and when brigaded therewith form their part of a superclass *Sauropsida*. The only living representatives of *Reptilia* are turtles or tortoises, crocodiles or alligators, lizards or saurians, and snakes or serpents, respectively constituting the four orders *Chelonida*, *Crocodylia*, *Lacertilia*, and *Ophidia*; and one living lizard, known as *Hatteria*, *Sphenodon*, or *Rhynchocephalus*, forming by itself an order *Rhynchocephalia*. In former times there were other orders of strange and huge reptiles, as the *Ichthyopterygia* or *Ichthyosauria*, the *ichthyosaurs*; *Anomodontia*; *Dinosauria*, by some ranked as a subclass and divided into several orders; *Ornithosauria* or *Pterosauria*, the pterodactyls; and *Plesiosauria* or *Sauropterygia*, the plesiosaurs. See the technical names, and cuts under *Crocodylia*, *Ichthyosauria*, *Ornithosauria*, *Plesiosaurs*, *Plesiosauria*, *ptero-dactyl*, and *Python*.

republic (rē-pub'lik), *n.* [Early mod. E. also *republick*, *republicke* (= *D. republik* = *G. Dan. Sw. republik*; < OF. *republicque*, *F. république* = Sp. *república* = Pg. *república* = It. *repubblica*,

repubblica, < *L. res publica*, prop. two words, but commonly written as one, *respublica* (abl. *re publicā*, *republicā*), the commonwealth, the state, < *res*, a thing, + *publica*, fem. of *publicus*, public: see *real* and *public*.] 1. The commonwealth; the state.

That by their deeds will make it known

Whose dignity they do sustain;

And life, state, glory, all they gain,

Count the republic's, not their own.

B. Jonson, Catiline, II. (cho.).

2. A commonwealth; a government in which the executive power is vested in a person or persons chosen directly or indirectly by the body of citizens entitled to vote. It is distinguished from a monarchy on the one hand, and generally from a pure democracy on the other. In the latter case the mass of citizens meet and choose the executive, as is still the case in certain Swiss cantons. In a republic the executive is usually chosen indirectly, either by an electoral college as in the United States, or by the National Assembly as in France. Republics are oligarchic, as formerly Venice and Genoa, military, as ancient Rome, strongly centralized, as France, federal, as Switzerland, or, like the United States, may combine a strong central government with large individual powers for the several states in their particular affairs. See *democracy*.

We may define a republic to be . . . a government which derives all its powers directly or indirectly from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behaviour.

Madison, The Federalist, No. 39.

The constitution and the government [of the United States] . . . rest, throughout, on the principle of the concurrent majority; and . . . it is, of course, a Republic, a constitutional democracy, in contradistinction to an absolute democracy; and . . . the theory which regards it as a government of the mere numerical majority rests on a gross and groundless misconception.

Cathoun, Works, I. 185.

During the period of the civil war many war Democrats acted with it. It first nominated a candidate for President in 1856. residual (rē-zīd'ū-ā), *a.* and *n.* [= *F.* *résiduel* < NL. **residualis* < L. *residuum*, *residue*: see *residium*, *residue*.] **I. a.** Pertaining to or having the character of a residuum; remaining. — **Residual abscess.** (a) A collection of pus forming in or around the center of a previous inflammation. (b) A chronic abscess in which the contents have been mostly absorbed. — **Residual air.** See *air*. — **Residual analyst,** the calculus of differences. This is the old designation, employed by Lalande, 1764. — **Residual calculus**

the calculus of residuals or residues. See II.—**Residual charge**, a charge of electricity spontaneously acquired by coated glass, or any other coated dielectric arranged as a condenser after a discharge, apparently owing to the slow return to the surface of that part of the original charge which had penetrated within the dielectric, as in the Leyden jar. (*Faraday*.) In such cases there is said to be electric absorption. It is doubtless due to the fact that the solid dielectric does not immediately recover from the strain resulting from the electric stress. Also called *dielectric after-working*.—**Residual estate**, residuary estate.—**Residual figure**, in *geom.*, the figure remaining after subtracting a less from a greater.—**Residual magnetism**. See *magnetism*.—**Residual quantity**, in *alg.*, a binomial connected by the sign — (minus): thus, $a - b$, $a - \sqrt{b}$ are residual quantities.

II. n. 1. A remainder; especially, the remainder of an observed quantity, after subtracting so much as can be accounted for in a given way.—2. The integral of a function round a closed contour in the plane of imaginary quantity inclosing a value for which the function becomes infinite, this integral being divided by $2\pi i$. An earlier definition, amounting to the same thing, was the coefficient of z^{-1} in the development of the function a in a sum of two series, one according to ascending, the other according to descending powers of z . If the oval includes only one value for which the function becomes infinite, the residual is said to be taken for or with respect to that value. Also *residue*.

3. A system of points which, together with another system of points of which it is said to be the residual, makes up all the intersections of a given curve with a plane cubic curve.—**Integral residual**, the residual obtained by extending the integration round a contour including several values of the variable for which the function becomes infinite.—**Total residual**, the residual obtained by integrating round a contour including all the values of the variable for which the function becomes infinite. Also called *principal residual*.

'Tis enough to lose the legacy, or the *residuary* advantage of the estate left him by the deceased.

Ayliffe, Farergon.

Residuary clause, that part of a will which in general language gives whatever may be left after satisfying the other provisions of the will.—**Residuary devisee** or *legatee*, in *law*, the legatee to whom is bequeathed the residuum.—**Residuary gum**, the dark residuary matter from the treatment of oils and fats in the manufacture of stearin, used in coating fabrics for the manufacture of roofing.—**Residuary legacy**. See *legacy*.

residue (rez'ī-dū), n. [Early mod. E. also *residew*; < ME. *residuc*, < OF. *residu*, F. *résidu* = Sp. Pg. It. *residuo*, < L. *residuum*, a remainder, neut. of *residuus*, remaining, < *residere*, remain, reside: see *reside*. Doublet of *residium*.] 1. That which remains after a part is taken, separated, removed, or dealt with in some other way; what is left over; remainder; the rest.

(b) That which remains of a testator's estate after payment of debts and particular legacies, and is undisposed of except it may be by a general clause or residuary legacy.—3. In the theory of numbers, the remainder after division, especially after division by a fixed modulus; in the integral calculus, the integral of a monodromic function taken round a pole or poles: same as *residual*. 2.—**Biquadratic residue**, the same as a *cubic residue*, except that it refers to a fourth power instead of to a cube. Thus, any fourth power of an integer divided by 5 gives as remainder either 0 or 1. These are, therefore, the *biquadratic residues* of 5.—**Cubic residue**, a number which, being added to a multiple of a number of which it is said to be a residue, gives a cube. Thus, every exact cube divided by 7 gives as remainder either 0, 1, or 6. These are, therefore, the *cubic residues* of 7.—**Method of residues**. See *method*.—**Quadratic residue**. See *quadratic*.—**Trigonal residue**, a number which, added to a multiple of another num-

ber of which it is said to be a residue, will give a trigonal number. Thus, 1, 3, 6, 10, 2, 8, are the *trigonal residues* of 13. = *Syn.* 1. *Rest*, etc. See *remainder*.

New York Produce Exchange Report (1888-9), p. 279.

2. Specifically, in *law*, that part of an estate which is left after the payment of charges, debts, and particular bequests; more strictly, the part so left which is effectively disposed of by a residuary clause. Sometimes the subject of a particular bequest which proves ineffectual passes by law to the heir or next of kin, instead of falling into the residuum.

Pg. resistencia* = *It. resistenza*, < *ML. *resistentia*, < *L. resisten(t)-s*, ppr. of *resistere*, resist: see *resist*, *resistant*.] 1. The act of resisting; opposition; antagonism. Resistance is *passive*, as that of a fixed body which interrupts the passage of a moving body; or *active*, as in the exertion of force to stop, repel, or defeat progress or design.

Nae *resistans* durst they mak. *Battle of Harlaw* (Child's Ballads, VII. 183).

He'll not swagger with a Barbary hen, if her feathers turn back in any show of *resistance*. *Shak., 2 Hen. IV.*, ii. 4. 109.

2. The force exerted by a fluid or other medium to retard the motion of a body through it; more generally, any force which always acts in a direction opposite to the residual velocity, or to any component of it: as, *resistance* to shearing. In a phrase like this, *resistance* may be defined as a stress produced by a strain, and tending to restoration of figure. But the resistance is not necessarily elastic—that is, it may cease, and as resistance does cease, when the velocity vanishes. In the older dynamical treatises, resistance is always considered as a function of the velocity, except in the case of friction, which does not vary with the velocity, or at least not much. In modern hydrodynamics the viscosity is taken into account, and produces a kind of resistance partly proportional to the velocity and partly to the acceleration. The theory of resistance still remains imperfect.

Energy, which is force acting, does work in overcoming *Resistance*, which is force acted on and reacting. *G. H. Lewes, Probs. of Life and Mind*, II. v. § 5.

3. In *elect.*, that property of a conductor in virtue of which the passage of a current through it is accompanied by a dissipation of energy; the transformation of electric energy into heat. It is one of the two elements upon which the strength of an electric current depends when the flow is steady; the other is electromotive force, and the relation between them is generally expressed by the equation $C = E/R$, which is Ohm's law. *Resistance* may therefore be defined as the ratio of the electromotive force to the current strength ($R = E/C$), the flow being assumed to be steady. For simple periodic alternate currents, the resistance increases as the rapidity of alternation increases, and it also depends on the form of the conductor. Resistance to such currents is sometimes called *impedance* and also *virtual resistance*, that for steady flow being named *ohmic resistance*. In general, resistance is proportional to the length of the conductor and inversely proportional to its cross-section. It also varies with the temperature of the conductor, the nature of the material of which it is composed, the stress to which it is subjected, and in some instances with other physical conditions, as in the case of selenium, the resistance of which diminishes as the intensity of the

light to which it is exposed increases. It is the reciprocal of conductivity. The unit of resistance is the ohm (which see). The designation *resistance* is also applied to coils of wire or other material devices which are introduced into electric circuits on account of the resistance which they offer to the passage of the current. The resistance of a conductor may be measured by Wheatstone's bridge. This is a device for the accurate comparison of electric resistances, invented by Christie and brought into notice by Wheatstone. It consists essentially of a complex circuit of six conductors, arranged as shown in the cut. A current from the battery *B* enters at the junction of *a* and *c*, and, after dividing into parts depending on the relative resistances of the branches *a*, *b*, *c*, and *d*, returns to the battery through the junction of *b* and *d*. *G* is a galvanometer joined to the junctions *a* and *b* and *c* and *d*. When the relative resistances are such that *a* : *b* :: *c* : *d*, no current will flow through the galvanometer. If *a* and *b* are comparable and adjustable resistances, it is only necessary to establish this condition in order to know the ratio of *c* to *d*. Many modifications of the bridge have been devised.—**Center of resistance.** See *center*.—**Conduction resistance,** the resistance offered by a conductor to an electric current.—**Contact resistance.** See *contact*.—**Curve of elastic resistance.** See *curve*.—**Living resistance,** the work required to produce a sudden strain of a body, especially a sudden elongation of a solid.—**Magnetic resistance,** the reciprocal of magnetic conductivity or permeability. The magnetic flux, or total number of magnetic lines of force passing through a cross-section of any magnetic circuit, may be given in an expression analogous to that giving the strength of an electric current in terms of the electromotive force and resistance. The denominator of the fraction represents the magnetic resistance, sometimes called *magnetic reluctance*.—**Passive resistance,** a friction or similar force opposing the motion of a machine.—**Principle of least resistance,** the principle that when a structure is in equilibrium the passive forces, or stresses occasioned by minute strains, are the least that are capable of balancing the active forces, or those which are independent of the strains.—**Solid of least resistance,** in *mech.*, the solid whose figure is such that in its motion through a fluid it sustains less resistance than any other having the same length and base, or, on the other hand, being stationary in a current of fluid, offers the least interruption to the progress of that fluid. In the former case it has been considered the best form for the stem of a ship; in the latter, the proper form for the pier of a bridge. The problem of finding the solid of least resistance was first proposed and solved by Newton, but only for hypothetical conditions extremely remote from those of nature.—**Specific resistance,** the resistance offered by a conductor of any given material the length of which is one centimeter and the cross-section one square centimeter.—**Transition resistance,** the resistance to an electric current in electrolysis caused by the presence of the ions at the electrodes.—**Syn.** 1. (*b*) The prolongation or increase of sound by the sympathetic vibration of other bodies than that by which it is originally produced. It is carefully utilized in musical instruments, as by means of the sounding-board of a pianoforte, the body of a violin, or the tube of a horn. In many wind-instruments, like the flute, and the flue-pipes of an organ, the pitch of the tone is almost wholly determined by the shape and size of the resonant cavity or tube. Diagrammatic View of a Section of the Nervous Elements of the Retina, the merely connective elements being not represented. Magnified about 150 diameters: *a*, the rods; *b*, the cones; *c*, the cones; *d*, *e*, granules of the outer nuclear layer, which these are connected; *d*, *e*, interwoven very delicate nervous fibers of the outer molecular layer, from which fine nervous filaments bearing granules of the inner nuclear layer (*f*, *g*) proceed toward the front surface; *g*, *g*, continuation of these fine nerves in the inner molecular layer, which become convoluted and interwoven with the processes of the ganglionic corpuscles *h*, *h*; *i*, expansion of the fibers of the optic nerve.

fine network, < *L. rete*, a net; see *rete*.] The innermost and chiefly nervous coat of the posterior part of the eyeball, between the choroid coat and the vitreous humor. It extends from the entrance into the eyeball of the optic nerve toward the crystalline lens, terminating in the ora serrata. A modified division of the retinal structure is, however, continued forward as the pars ciliaris retinae. The retina consists of a delicate and complex expansion and modification of the optic nerve, supported by a network of connective tissue. It may be divided into ten layers: (1) internally, next the hyaloid membrane of the vitreous humor, the internal limiting membrane, formed of the expanded bases of the fibers of Müller; (2) the fibers of the optic nerve; (3) layer of ganglion-cells; (4) internal molecular or granular layer; (5) inner nuclear layer; (6) external molecular or granular layer; (7) external nuclear layer; (8) external limiting membrane, which is connected with the ends of Müller's fibers; (9) layer of rods and cones, or bacillary layer; (10) pigmentary layer. In the center of the back part of the retina, near the line of the optic axis, is the macula lutea, the most sensitive part of the retina; and in the center of the macula is a depression, the fovea centralis, in which the rods are absent. The color of the macula is due to a yellow pigment. About one-tenth of an inch internally to the fovea is the point of entrance of the optic nerve with its central artery; the retina is incomplete at this point, and constitutes the "blind spot." The nerve-fibers have been estimated to number 400,000 broad and as many narrow fibers, and for each fiber there are 7 cones, 100 rods, and 7 pigment-cells. The retina serves the purpose of vision in being the organ through or by means of which vibrations of luminiferous ether excite the optic nerve to its appropriate activity. See *eye* 1.

Retribution theory, the theory that the condition of the soul after death depends upon a judicial award of rewards and punishments based upon the conduct pursued and the character developed in this life. It is distinguished from the theory that the future life is (a) simply a continuance of the present (continuance theory); (b) a life of gradual development by means of discipline (purgatory), or future redemptive influences (future probation).

On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the soul after death seems comparatively seldom to turn on a judicial system of reward and punishment. Such difference as they make between the future conditions of different classes of souls seems often to belong to a remarkable intermediate doctrine, standing between the earlier continuance theory and the *retribution theory*.

There is a wide difference of opinion as to the interpretation and significance of this book. The schools of interpretation are of three principal kinds. The first school, that of the preterists, embraces those who hold that the whole or by far the greater part of the prophecy of this book has been fulfilled; the second is that of the historical interpreters, who hold that the prophecy embraces the whole history of the church and its foes, from the first century to the end of the world; the third view is that of the futurists, who maintain that the prophecy, with perhaps the exception of the first three chapters, relates entirely to events which are to take place at or near to the second coming of the Lord. reversing-layer (rē-vērs'ing-lā'ēr), *n.* A hypothetical thin stratum of the solar atmosphere, containing in gaseous form the substances whose presence is shown by the dark lines of the solar spectrum, and supposed to be the seat of the absorption which produces the dark lines. The spectrum of this stratum, if it exists, must be one of bright lines—the negative of the ordinary solar spectrum—and should be seen at the moment when a solar eclipse becomes total. The observation of such a bright-line spectrum, first made by Professor C. A. Young in 1870, and since repeated more or less completely by several eclipse observers, led to the hypothesis. It still remains doubtful, however, whether all the Fraunhofer lines originate in such a thin stratum, or whether different regions of the solar atmosphere cooperate in their formation.

A common device of this nature for a steam-engine is a rock-shaft to operate the valves, having, on opposite sides, two levers to either of which may be connected the rod from an eccentric on the main shaft. The most usual form of reversing-motion for a locomotive is the link-motion.

They may be entirely within these cells, or protrude from them, are readily pressed out, and often found in abundance in the mucus secreted and deposited by the worms. The function of the rhabdites seems related to the tactile sense. They vary in size and form, and also in their local or general dispersion on the body of the worm. They are produced in the ordinary epidermic cells, or in special formative cells beneath the integument, whence they work their way to the surface. Some similar bodies, of granular instead of homogeneous structure, are distinguished as *pseudo-rhabdites*. See *sagittibeyst*.

Worms of this form develop from the embryo in damp earth, where they lead an independent life till they migrate into their host, where, after further transformations, they acquire the sexually mature condition, though this is sometimes attained while they are still free. Members of the genera *Leptodera*, *Pelodera*, *Rhabdonema*, and others have been referred to *Rhabditis* under various specific names. *Rhabditis genitalis*, a small round worm which has been found in the urine.

Rhabdocæla (rab-dō-sē'lā), *n. pl.* [*NL., < Gr. ῥάβδος, a rod, + καὶ, hollow.*] A prime division of turbellarian worms, forming a suborder of *Turbellaria*, contrasted with *Dendrocaela* (which see), containing small forms whose intestine, when present, is straight and simple. The body is cylindric (as compared with other flatworms), but more or less flattened; the sexual organs are usually hermaphrodite; there is no anus (see *Apocæta*), but a mouth, the position of which varies extremely in different genera, and usually a protrusile pharynx or buccal proboscis. In most forms the alimentary canal is distinct; in others (see *Acala*) it is not fairly differentiated from the general digestive parenchyma. There are numerous forms of this group, mostly inhabiting fresh water, though some are marine. They live on the juices of small worms, crustaceans, and insects, which they suck after enveloping their prey in a sort of mucus secreted by the skin and containing rhabdites. (See *rhabdite*, 2.) The group is divided, mainly upon the character of the intestine, into three sections: (1) *Acala*, without differentiated intestine, represented by the family *Convolvulidae*; (2) *Rhabdocæla* proper, with definite intestinal tract, a nervous system and excretory organs present, compact male and female generative glands, complicated pharynx, and generally no ooliths—embracing numerous forms of several different families, both of fresh and salt water; (3) *Allocaela*, resembling (2), but with ooliths, represented by one family, *Monotidae*. Another division, based mainly upon the position or other character of the mouth, is directly into a number of families, as *Convolvulidae*, *Opisthomidae*, *Derostomidae*, *Metostomidae*, *Prostomidae*, and *Microstomidae*. Also called *Rhabdocæla*.

rhagon (rag'ōn), *n.* [NL., < Gr. *ῥάξ* (*pay*), a grape.] A type of sponge-structure resulting from the modification of a primitive form, as an olynthus, by the outgrowth of the endoderm into a number of approximately spherical chambers communicating with the exterior by a prosopyle and with the paragastric cavity by an apopyle (see *prosopyle*), with conversion of the flagellated into pavement epithelium except in the chambers. The rhagon occurs as a stage in the early development of some sponges, and others exhibit it in the adult state. The structure is named from the grape-like form of the spherical chambers. The term is correlated with *ascon*, *leucon*, and *sycon*. Also called *dysyscus*.

This may be termed the aphodal or racemose type of the *Rhagon* system, since the chambers at the ends of the aphodi radiating from the excurrent canal look like grapes on a bunch. *W. J. Sollas*, *Encyc. Brit.*, XXII, 415.

It includes about 475 species, classed in 5 tribes and 42 genera, widely diffused through warm countries. They are commonly erect trees or shrubs, often thorny, bearing undivided alternate or opposite stipulate leaves, which are often coriaceous and three- to five-nerved. The small flowers are greenish or yellow, commonly in axillary cymes, which are followed by three-celled capsules or drupes, sometimes edible, sometimes hard and indehiscent. P. de Candolle, 1825), < *Rhamnus* + *-æ*.] The principal tribe of the order *Rhamnaceae*, characterized by a dry or drupaceous fruit containing three stones which are indelhiscent or two-valved. Although this name was originally employed for the order, it is better to restrict it to the tribe, and adopt the later form *Rhamnaceae* of Lindley for the ordinal term, as is very generally done. See *Rhamnus*, *Ceanothus*, *Sageretia*, and *Pomaderris* for the chief among its 21 genera.

It is characterized by a thin disk sheathing the bell-shaped calyx-tube and bearing the four or five stamens on its margin; by a free ovary often immersed within the disk; and by its fruit, an oblong or spherical drupe, surrounded at its base by the small calyx-tube, and containing two, three, or four hard one-seeded stones. There are about 66 species, natives of warm and temperate regions, frequent in Europe, Asia, and America, rare in the tropics. They bear alternate petioled and feather-veined leaves, which are either entire or toothed, deciduous or evergreen, and are furnished with small deciduous stipules. The flowers are in axillary racemes or cymes, and are commonly dioecious in the typical section, but not so in the principal American species (the genus *Frangula* of Brongniart), which also differ in their unfurrowed seeds and flat fleshy seed-leaves. A general name for the species is *buckthorn*, the common buckthorn being *R. cathartica* of the northern Old World, planted and sparingly nat-

uralized in the United States. It is used as a hedge-plant. Its bark is medicinal, like that of *R. frangula*; its black berries afford a now nearly disused cathartic, and with

those of some other species yield by treatment the pigment known as *sop-green*. *R. frangula*, of the same nativity, called *black* or *berry-bearing alder*, *alder-buckthorn*, and (*black*) *dogwood*, affords one of the very best gunpowder-charcoals, while its bark is an official cathartic. (See *frangula*, *frangulin*.) The fruit of *R. infectiorius* and other species forms the French, Turkey, or Persian berries of the dyers. (See under *Persia*.) In China the bark of *R. tinctorius* (*R. chlorophorus*) and *R. Dauricus* (*R. utilis*) affords the famous green indigo, or *lokao*, there used to dye silks, also introduced at Lyons. (For other Old World species, see *alaternus* and *lotus-tree*, 3.) *R. Carolinianus* of the southern United States is a shrub or small tree, bearing a sweet and agreeable fruit. The berries of *R. croceus* of California are much eaten by the Indians. *R. Californicus*, the California coffee-tree, yields an unimportant coffee-substitute. *R. Purshianus* of the western coast yields the casahua sagrada bark (see under *bark*), sometimes called *chittam-bark*, whence probably, in view of the hard fine wood, the name *shittim-wood*. See *bearberry*, 2, and *redwood*, 2.

Sometimes they wrote several verses or sentences of a poet on so many pieces of wood, paper, or the like, shook them together in an urn, and drew out one. . . . Sometimes they cast dice on a table on which verses were written, and that on which the die lodged contained the prediction. A third manner was by opening a book, and pitching on some verse at first sight. In the lower vertebrates the rhinencephalon is relatively large, and evidently a distinct part of the brain. In the higher it gradually diminishes in size, becoming relatively very small, and apparently a mere outgrowth of the cerebrum. Thus, in man the rhinencephalon is reduced to the so-called pair of olfactory nerves, from their roots in the cerebrum to the olfactory bulbs whence are given off the numerous filaments, the proper olfactory nerves,

which pierce the cribiform plate of the ethmoid, and ramify in the nose. The rhinencephalon, like other encephalic segments, is paired, i. e. double. That is, consists of right and left halves. It is primitively hollow, as has its upper ventricle which, however, is entirely obliterated in the adults of the higher vertebrates. This hollow is a prolongation of the system of cavities common to the other encephalic segments, and known as the *rhinencephalic*. Also *rhinencephal*. See cuts under *Petroneurontidae*, *Lam.*, brain (cut 2), and *encephalon*.

A large pachydermatous perissodactyl mammal with a horn on the nose; any member of the genus *Rhinoceros* or family *Rhinocerotidae*. There are several living as well as many fossil species. They are usually quadrupeds, having an extremely thick and hard skin, thrown into various buckler-like plates and folds. The legs are short, stout, and clumsy, with small feet, whose three digits are incased in hoof-like hoofs. The tail is short; the ears are high and pointed. The head is very large and unshapely, supported on a thick stocky neck, the muzzle is blunt, and the upper lip is freely movable. The head is especially large in the male, and there are usually one or two large upright horns, without any bony core, the substance of the horn being epidermal only. When two horns are present they are one behind the other in the male, and the hinder one rests over the frontal bone of the brain, being in any case borne upon the frontal bone. Rhinoceroses live mainly in marshy places, in thick or rank vegetation, and subsist entirely upon vegetable food. The living species are now confined to the warm parts of Africa and Asia, and are hairless or nearly so. But the animals formerly had a much more extensive range, as is shown in the Old World but also in America. The fossil remains of the extinct species is *R. tichorhinus*, the so-called rhinoceros, which formerly ranged over Europe, and the British Isles. Of the existing one-horned

male sex a large up-curved horn on the head, resembling somewhat the horn of the rhinoceros, as well as a more or less developed prothoracic horn. The common rhinoceros-beetle of the United States, *Dynastes tityus*, the largest of the North American beetles, has two large horns directed forward, one arising from the thorax and one from the head, in the male beetle only. The general color is greenish-gray with black markings, and between this form and a uniform brown there are many gradations. The larva feeds in decaying stumps and logs. Both beetle and larva have a peculiar disagreeable odor, which, when they are present in any number, becomes insupportable. *D. hercules* of South America is another rhinoceros-beetle, specifically called the *Hercules-beetle*, whose prothoracic horn is immensely long. See also cut under *Hercules-beetle*.

rhizomania (rī-zō-mā-ni-ä), *n.* [*NL., < Gr. ρίζα, a root, + μανία, madness.*] In *bot.*, an abnormal development of adventitious roots peculiar to many plants, as ivy, screw-pines, and figs, which send out roots from various parts, just as trees produce adventitious buds. In some plants rhizomania is an indication that there is some defect in the true root, in consequence of which it cannot supply sufficient nourishment to the plant. In such cases rhizomania is an effort of nature to supply the deficiency. This is the case in common laurel, in which plant rhizomania generally forebodes death. The phenomenon is also frequently seen in apple-trees, from the stems of which bundles of roots are sent out; these, absorbing moisture and finally decaying, are a cause of canker on the tree.

rhizome (rī-zōm), *n.* [= *F. rhizome*, < *NL. rhizoma*, < *Gr. ρίζωμα, root, < ρίζω, cause to take root, in pass. take root, < ρίζα, root: see root*.] In *bot.*, a stem of root-like appearance, horizontal or oblique in position, lying on the ground or subterranean, bearing scales instead of leaves, and usually producing from its apex a leafy shoot or scape. Rhizomes may be slender, with well-marked nodes, as in mints, couch-grass, etc., or thickened with stores of nutriment, as in species of iris, Solomon's-seal, etc.—in the latter case

Rhizophora (rī-zōf'ō-rā), *n.* [*NL. (Limæus, 1737), named with ref. to the aerial roots; neut. pl. of rhizophorus: see rhizophorous.*] A genus of polypetalous trees, the mangroves, type of the order *Rhizophoraceae*, and of the tribe *Rhizophoreæ*. It is characterized by a four-parted calyx, surrounded with a cupule or involucre of partly united bracts, by its four petals and eight to twelve elongated and nearly sessile anthers, which are at first many-celled, and by a partly inferior ovary which is prolonged above into a fleshy cone and bears two pendulous ovules in each of its two cells. There are 2 (or, as some regard them, 5) species, frequent on muddy or coral shores in the tropics, there forming dense and almost impassable jungles known as mangrove-swamps. They are trees with thick cylindrical and scarred branchlets, bearing opposite thick and smooth coriaceous leaves, which are ovate or elliptical and entire. Their large rigid flowers are borne in axillary clusters, followed by a nut-like one-seeded fruit. The seed is remarkable for germinating while yet in the long-persistent fruit. It contains a large embryo with a very long club-shaped radicle, which soon pierces the point of the hard pericarp and lengthens till it reaches the mud, or becomes a foot long before falling. The mangrove is also remarkable for spreading by aerial roots. The ordinary species is *R. mucronata*, which reaches to semitropical Florida, the delta of the Mississippi, and Texas. See *mangrove*, 1.

It has hitherto 60 species in 17 genera and 3 tribes, all tropical, and most of them forming dense and malarious jungles about river mouths and along shores. They are usually extremely smooth, with round and pectinate branchlets, and opposite thick and rigid leaves, which are commonly entire and have elongated and very exserted intrapetiole stipules. They bear axillary cymes, panicles, spikes, or racemes of rather inconspicuous flowers.

The parasitic cells enter the cells of the host plant at a very early stage of their existence, and gradually develop at the expense of the protoplasmic contents of the latter. *R. Dicksonii* is parasitic on species of *Ectocarpus*. **rhizopod** (rī-zō-pod), *a.* and *n.* [*< NL. "rhizopodium" (as a noun, in def. 2, rhizopodium), < Gr. ρίζα, root, + πούς (ποδ-) = E. foot.*] *I. a.* Provided with pseudopods, as an animalcule: having processes of sarcode, as if roots, by means of which the animalcule is attached or moves; root-footed; specifically, of or pertaining to the *Rhizopoda*, in any sense. Also *rhizopodous*.

II. n. 1. A member of the *Rhizopoda*, in any sense. — *2.* In *bot.*, same as *rhizopodium*.

Rhizopoda (rī-zōp'ō-dī), *n. pl.* [*NL.: see rhizopod.*] *1.* In Dujardin's system of classification (1841), the third family of "diversiform infusorians without visible locomotory appendages"—that is, without permanent appendages, as cilia or flagella. This is the original meaning of the word, since much extended. Dujardin included in his *Rhizopoda* the 8 genera *Arcella*, *Difflugia*, *Trinema*, *Euglypha*, *Gromia*, *Miliola*, *Cristellaria*, and *Vorticella*.

2. The lowest class of *Protozoa*, composed of simple or multiple animalcules without definite or permanent distinction of external parts, and provided with diversiform temporary or permanent pseudopodial prolongations of the body-substance, by means of which locomotion, fixation, and ingestion are effected. There is no mouth or special ingestive area; the sarcode may be distinguishable into an outer ectoplasma and an inner endoplasma; a nucleus and nucleolus (endoplast and endoplastic) may be present; and most of these animalcules secrete a shell or test, often of great beauty and complexity. The rhizopods are minute, usually microscopic organisms, some or other forms of which abound in both salt and fresh waters. The characteristic pseudopodia are highly diverse in form, and constantly or digitate processes and fine slender rays, both of which may run together or interlace. The valuation and limitation of the *Rhizopoda* have varied with different authors. A normal amoeboid protozoan is a characteristic example of this class. Other forms included under *Rhizopoda* are the so-called monera of the order *Monera*; the *Foraminifera*, with a calcareous shell; and the *Radiolaria*, with a silicious shell. By common consent the sponges, which have been classed with *Rhizopoda*, are now excluded, even by those who still consider these organisms as protozoans. See *cut* under *Amaba*, *Foraminifera*, and *Radiolaria*.

The fruit is a woolly pod, splitting septically from the apex into valves, and filled with seeds like fine sand, each containing a cylindrical embryo and fleshy albumen. Most of the species, and all of those bearing flowers, produce their new growths below the flowers, which form a terminal inflorescence destitute of leaves, and developed from a large scaly bud. The leaves in the typical species, forming the section *Rhododendron* proper, are evergreen and coriaceous; but they are deciduous in the sections *Azalea* and *Tsusi*, which include the American species commonly known as *azaleas*, and produce leaves closely encircling the flowers, or, in *Tsusi*, mixed with them. The flowers, nearly or quite 2 inches across, often reach in *R. Aucklandii* a breadth of 6 inches. See *pinkster-flower*.

2. [*l. c.*] Any one of the many species of the above genus, belonging to the section *Rhododendron*; the rose-bay. The rhododendrons are hardy shrubs, much cultivated for their evergreen leathery leaves and profusion of beautifully formed and colored flowers. The ordinary species of American outdoor plantations is *R. Catawbiense*, the Catawba or Carolina rhododendron, hybridized with the more tender exotics *R. Ponticum* and *R. arboreum*. The Catawba species grows from 3 to 6, rarely 20, feet high, has oval or oblong leaves and broadly bell-shaped lilac-purple or (in culture) variously colored flowers. It is native in the Alleghenies from Virginia southward. It has also been largely cultivated in Europe, and there are hundreds of varieties. The great rhododendron (or laurel), *R. maximum*, abounds in the Al-

Flowering Branch of the Great Laurel (*Rhododendron maximum*).

leghenies, and is found as far north as Maine and Canada. It is commonly taller than *R. Catawbiense*, with narrower leaves, and flowers pink or nearly white with a greenish throat. It is a fine species, but much less cultivated than the last; it affords some hybrids. The Californian rhododendron, *R. Californicum*, resembles the Catawba rhododendron, but has more showy flowers. It deserves cultivation, and has proved hardy in England. The Pontic rhododendron, *R. Ponticum*, is the most common species of European gardens, hardly only as a low shrub in the northern United States. *R. arboreum*, the tree rhododendron, is a fine Himalayan species, 25 feet high, with the leaves silvery-white beneath, and the flowers scarlet varying to white. The Lapland rhododendron, *R. Lapponicum*, is a dwarf arctic and alpine species of both hemispheres, growing prostrate in broad tufts. The Siberian or Dahurian rhododendron, *R. Dauricum*, a dwarf species, somewhat cultivated, bears its bright rose-purple flowers on naked shoots in early spring.—**Indian rhododendron.** See *Melastoma*.

The fronds are dark-red, filiform or subcompressed and pinnately decomposed, with filiform branches, the tetraspores tripartite, the cystocarps sessile or pedicellate, and the spores pyriform. The genus is small, and mostly confined to high latitudes in both hemispheres. There are two species or forms on the New England coast.

This is the largest suborder of the *Florideæ* and contains many of the most beautiful seaweeds. It is characterized mainly by the cystocarpic fruit, which is external and has the spores borne separately on short stalks. The fronds are usually filiform and branching.

(Duchamel du Monceau, 1767), so called from the rose-colored flowers; < Gr. *rhōdōn*, rose (see *rose*), the NL. word being based, as to form, on the *L. rhodora*, a plant, *Spiraea Ulmaria* or *Aruncus*, and said to be a Gallic word.] 1. A former genus of *Ericaceæ*, now included in *Rhododendron*, section *Azalea*, but still giving name to the tribe *Rhodoreæ*. It was set apart chiefly on account of its prominently two-lipped flower, of which the lower lip consists of two petals, completely separate, or much more nearly so than the three divisions of the upper lip. There was but one species. See def. 2.

2. [*l. c.*] A low deciduous shrub, *Rhododendron Rhodora* (*Rhodora Canadensis*), a native of cold and wet wooded places from Pennsylvania northward, often covering acres with its delicate rosy flowers, which appear before the leaves.

In May, when sea-winds pierced our solitudes,

Spreading its leafless blooms in a damp nook; . . .
The purple petals, fallen in the pool,
Made the black water with their beauty gay.
Emerson, The *Rhodora*.

It is characterized by having a wheel-shaped corolla and ten long stamens, and terminal, solitary, and long peduncled flowers. The only species, *R. Canadensis*, is a native of the Austrian and Italian Alps. It is a low branching shrub with scattered short-petioled leaves, which are elliptical-lanceolate, entire, evergreen, and shining. It bears rose-colored flowers large for the size of the plant, with spreading and curving stamens, the long slender peduncles and the calyx glandular-hairy. The whole plant in habit and flower resembles an azalea. The fruit is an erect five-furrowed globose capsule. Sometimes called *ground-custard*, translating the specific name.

Neither the Spaniards nor Portuguese retain in their speech that strong *Rhotacism* which they denoted by the double *rr*, and which Camden and Fuller notice as peculiar to the people of Carlton in Leicestershire. Southey, *The Doctor*, cccxiii.

3. Conversion of another sound, as *s*, into *r*.

That too many exceptions to the law of *rhotacism* in Latin exist has been felt by many scholars, but no one has ventured a theory that would explain them en masse. Amer. Jour. Philol., IX. 492.

Also spelled *rotacism*.

rhotacize (rô-ta-siz), *v. i.*; pret. and pp. *rhotacized*, ppr. *rhotacizing*. [*LGr. ῥωτακίζω*, make overmuch or wrong use of *r*, < *ῥω*, rho, the letter *p*, *r*. Cf. *iota-cism*.] 1. The general name for plants of the genus *Rheum*, especially for species affording the drug *rhubarb* and the culinary herb of that name. The specific source of the official *rhubarb* is still partially in question; but it is practically

in making tarts, pies, etc., is only of recent date. Attempts to use it as a wine-plant have not been specially successful. Some other species have a similar acid quality. From their stature and huge leaves, various *rubarbas* produce striking scenic effects, especially *R. Emodi*, the Nepal *rhubarb*, which grows 5 feet high and has wrinkled leaves veined with red; and still more the better-formed *R. officinale*. A finer and most remarkable species is *R. nobile*, the Sikkim *rhubarb*, which presents a conical tower of imbricating foliage a yard or more high, the ample shining-green root-leaves passing into large straw-colored bracts which conceal beautiful pink stipules and small green flowers. The root is very long, winding among the rocks. This plant is not easily cultivated.

2. The root of any medicinal *rhubarb*, or some preparation of it. *Rhubarb* is a much-prized remedy, remarkable as combining a cathartic with an astringent effect, the latter succeeding the former. It is also tonic and stomachic. It is administered in substance or in various preparations.

The patient that doth determine to receive a little *Rheubarb* suffereth the bitterness it leaveth in the throat for the profit it doth him gain by his fever.

1. A vertical circle of the celestial sphere. So says Hutton; but if so, it is difficult to understand how Kepler (*Epitome Astron.*, ii. 10), in order to explain def. 2, is driven to the trapezoidal figure of the points on the compass-card.

2. A point of the compass, a thirty-second part of the circle of the horizon, 11° 15' in azimuth.—3. The course of a ship constantly moving at the same angle to its meridian; a *rhub-line*.

rhub-line (rumb'lin), *n.* The curve described upon the terrestrial spheroid by a ship sailing on one course—that is, always in the same direction relatively to the north point. For long courses, especially in high latitudes, the *rhub-line* is not the shortest or geodetical line, which is substantially a great circle; for the *rhub-line* evidently goes round and round the pole, approximating to the equiangular spiral. Also called *loxodromic curve*.

Rhus (rus), *n.* [NL. (Tournefort, 1700), < L. *rhus*, < Gr. *ῥίος*, sumac.] A genus of shrubs and trees, belonging to the tribe *Spindiceæ* of the order *Anacardiaceæ*, the cashew-nut family. It is characterized by flowers with from four to ten stamens, a solitary ovule pendulous from a basilar stalk, a small fruit to six-lobed calyx, and four to six imbricated petals machined after flowering. The leaves are pinnate, ones to three foliolate, or sometimes simple; the fruit is a small compressed drupe. The plant often abounds in a caustic poisonous juice, sometimes exudes a varnish. There are about 120 species, found throughout subtropical and warm climates, but infrequent in the tropics. They are especially abundant at the Cape of Good Hope, also in eastern Asia. 1 species are found in southern Europe, a few in the East Indies and the Andes, and 13 in the United States. Several species, some useful for tanning, are known as *sumac*. (For poisonous American species, see *poison-ivy*, *poison-oak*, and *poison-wood*.) *R. Cotinus* is the smoke tree, mist-tree, or purple fringe-tree. (See *snake tree*; also *quining fruite*, under *fusile*.) A somewhat similar species, *R. coccinea*, is known as *chilam-wood*. *R. vernicifera* is the Japanese lacquer-tree or varnish tree. (See *lacquer tree*.) The kindred black-varnish tree is of the genus *Melanorrhiza*. *R. succedanea* is the Japanese wax-tree. *R. semialata* bears the Chinese galls. *R. coccinea*, the lithy-tree of Chilli, is a small tree with very hard useful wood. *R. integrifolia*, though often but a shrub, is said to be the local "mahogany" in Lower California. See cut in preceding column.

rhusma (rus'mâ), *n.* [Also *rhusma*; origin unknown.] A depilatory composed of lime, opiment, and water, and called in the United States Dispensatory "Atkinson's depilatory." It is used not only for removing superfluous human hair, but also to some extent in tanning and tawing for removing hair from skins.

The larvae inhabit fixed stone cases in torrents, and the pupæ are enclosed in a silken cocoon. The forms are numerous, and are mostly European.

Rhyacophilus (ri-ak'ô-fil'i-lus), *n.* [NL. (Kaup, 1829), < Gr. *ῥίαξ* (*rhax*), a stream, + *φιλέω*, love.] A genus of *Sceloporidae*, belonging to the totamine section, having a slender bill little longer than the head and grooved to beyond the middle, legs comparatively short, a moderate basal web between the outer and middle toes, the plumage dark-colored above with small whitish spots, and the tail rounded, fully barred with black and white; the green sandpipers or solitary tattlers. settled that *R. officinale* is one of the probably several species which yield it. *R. palmatum*, *R. Franzenbachii*, and *R. hybridum* also have some claims. The article is produced on the high table-lands of western China and eastern Tibet, and formerly reached the western market by the way of Russia and Turkey, being named accordingly. It is now obtained from China by sea (Chinese *rhubarb*), but is more mixed in quality, from lack of the rigorous Russian inspection. Various species, especially *R. Rapaeticum* and *R. palmatum*, have been grown in England and elsewhere in Europe either of species or of conditions. The common garden *rhubarb* is *R. Rapaeticum* and its varieties. It is native from the Volga to central Asia, and was introduced into England about 1573. Its leaves were early used as a pot herb, but the now common use of its tender acidulous leafstalks as a spring substitute for fruit

The thick-billed parrot is *R. pachyrhyncha*, found on or near the Mexican border of the United States, probably to be added to the fauna of the latter.

rhynchosaurian (ring-kō-sā'ri-an), *a.* and *n.* I. *a.* Pertaining to the genus *Rhynchosaurus*. II. *n.* A member of the *Rhynchosauridae*.

Rhynchosauridae (ring-kō-sā'ri-dō), *n. pl.* [NL. < *Rhynchosaurus* + *-idae*.] A family of fossil rhynchocephalian reptiles, typified by the genus *Rhynchosaurus*.

Rhynchosia (ring-kō'si-ä), *n.* [NL. (Loureiro, 1790), named from the keel-petals; irreg. < Gr. *ῥυγχος*, snout.] A genus of leguminous plants, of the tribe *Phaseoleae* and subtribe *Cajaneae*. It is characterized by its two ovules with central funiculus, by its compressed and often falcate pod, and by papilionaceous flowers with beardless style and terminal stigma. There are about 82 species, natives of warm regions, with some extratropical species in North America and South Africa. They are herbs or undershrubs, usually twining or prostrate. They bear compound resinous-dotted leaves of three leaflets, with ovate or lanceolate stipules, and sometimes with additional minute bristle-shaped stipels. The flowers are yellow, rarely purple, often with brown stripes on the keel, and are borne singly or in pairs along axillary racemes. *R. phaseoloides* of tropical America, a high-climbing vine, has the seeds black with a scarlet-yellow ring around the hilum, and from the use made of them is named *Mexican rosary-plant*. This and other species in the West Indies are included under the name *red beard-vine*. *R. minima*, a low twining tropical weed of both hemispheres, reaching into the United States, has the West Indian name of *wart-herb*.

Rhynchospora (ring-kos'pō-rä), *n.* [NL. (Vahl, 1806), < Gr. *ῥυγχος*, snout, beak, + *σπορος*, seed.] A genus of sedge-like plants, known as *beak-rush* or *beak-sedge*, belonging to the order *Cyperaceae*, type of the tribe *Rhynchosporaceae*. It is characterized by commonly narrow or acuminate spikelets in many and close clusters, which are terminal or apparently axillary; by an undivided or two-termed style; and by a nut beaked at its top by the dilated and persistent base of the style. There are about 200 species, widely scattered through tropical and subtropical regions, especially in America, where many extend into the United States; in the Old World only two similarly extend into Europe and Asiatic Russia. They are annual or perennial, slender or robust, erect or rarely diffuse or floating, often with leafy stems. The spikelets are disposed in irregular umbels or sessile heads, which are clustered, corymbose, or panicle. Most of the species of tropical America (*Haplostylae*) have capitate spikelets, commonly one-seeded, and a long undivided slender style; the typical species (*Dichostyleae*) have two- to four-seeded polymorphous spikelets, and a style deeply divided into two branches. *R. corniculata*, a species of the interior United States, from 3 to 6 feet high, has the special name of *horned rush*. rhyolite (ri'ō-lit), *n.* [Irreg. < Gr. *ῥιαξ*, a stream, esp. a stream of lava from a volcano (< *ῥέω*, flow; see *rheum*), + *λίθος*, a stone.] The name given by Richthofen to certain rocks occurring in Hungary which resemble trachyte, but are distinguished from it by the presence of quartz as an essential ingredient, and also by a great variety of texture, showing more distinctly than rocks usually do that the material had flowed while in a viscous state. The name *liparite* was given later by J. Roth to rocks of similar character occurring on the Lipari Islands. Non-vitreous rocks of this kind had previously been called *trachytic porphyries*, and they have also been designated as *quartz-trachytes*. Later Richthofen proposed the name of *nevadite* (also called *granitic rhyolite* by Zirkel) for the variety in which large macroscopic ingredients, like quartz and sanidine, predominated over the ground-mass, retaining the name *liparite*, and applying it to the varieties having a porphyritic or felsitic structure, and limiting the term *rhyolite* to the lithoidal and hyaline modifications, such as obsidian, pumice-stone, and perlite; and nearly the same nomenclature was adopted by Zirkel. Rosenbusch recognizes as structural types of the rhyolitic rocks *nevadite*, *liparite* proper, and glassy *liparite*, remarking that these names correspond closely to Zirkel's *nevadite*, *rhyolite*, and glassy *rhyolite* respectively. These rocks are abundant in various countries, especially in the Cordilleran region, and are interesting from their connection and association with certain important metalliferous deposits. See cut under *axiolute*.

In anat. and zool., a costa; a pleurapophysis, with or without a hemapophysis; the pleurapophyseal element of a vertebra, of whatever size, shape, or mode of connection with a vertebra. In ordinary language the term *rib* is restricted to one of the series of long slender bones which are movably articulated with or entirely disconnected from the vertebrae, occur in pairs, and extend to or toward the sternum or middle ventral line of the body. In many vertebrates such ribs are characteristic of or confined to the thoracic or dorsal region, and form, together with the corresponding vertebrae and with the sternum, a kind of bony cage for the thoracic viscera—the chest or thorax. Such ribs are called *thoracic* or *dorsal*, and are often the only free ribs an animal may possess, as is usually the case in mammals. In man there are twelve pairs of such ribs. The first of these articulate with the upper part of the side of the body of the first dorsal vertebra; the second to the ninth inclusive articulate at an intervertebral space, and consequently with two vertebrae apiece; the tenth, eleventh, and twelfth articulate with the single vertebra to which they correspond. The first to the tenth ribs articulate by their heads with bodies of vertebrae as above stated, and also by their shoulders with transverse processes, which latter articulations are lacking to the eleventh and twelfth ribs. The first seven ribs reach the sternum by means of costal cartilages, and are called *true ribs*; the last five ribs do not, and are called *false ribs*: of these last the first three join one another by means of their costal cartilages, while the last two are entirely free or "floating" at their ends. Only the bony part of a rib is a pleurapophysis; the gristly part, or costal cartilage, is a hemapophysis. Parts of a bony rib commonly distinguished are the *head* or *capitulum*, the *neck* or *cervix*, the *shoulder* or *tuberculum*, and the *shaft*. Most of the ribs are not only curved as a whole, but also somewhat bent at a point called the *angle*, and, moreover, twisted on their own axis. In man there are occasionally supernumerary cervical or lumbar ribs of ordinary character, that are extended from and freely jointed to their vertebrae; and all the human cervical vertebrae have rudimentary ribs ankylotized with their respective vertebrae, represented by that part of the transverse process which bounds the vertebral foramen in front. Mammals have frequently more or fewer than twelve pairs of thoracic ribs. Ribs occurring in any part of the vertebral column are named from that part:

Human Ribs, left side (rear view), the first, second, seventh, ninth, and twelfth shaded in detail, the others in outline—*a* without their costal cartilages

as, cervical, thoracic or dorsal, dorsolumbar, lumbar, or sacral ribs. In birds and reptiles the number of ribs is extremely variable, and their situation may extend from head to tail. Frequently they are jointed in the middle, or at the point where in a mammal the bony part joins the cartilaginous. Some of them may be free or floating at the vertebral as well as at the sternal end. Some ribs in birds bear peculiar splint-bones called *uncinate processes*. (See cut under *epipterica*.) In chelonians the ribs are fixed, and consolidated with broad plate-like dermal bones to form the carapace. The greatest number of ribs is found in some serpents, which have more than two hundred pairs. In some fishes, ribs are apparently doubled in number by forking; this is the principal reason why the bones of a shad, for example, seem so numerous. See also cuts under *carapace* and *skeleton*.

U't of his side he toc a rib,
And made a wimman him ful sib,
And heled him that side wel.

Evelyn, Diary, March 23, 1646.

Specifically—(a) Some part or organ of an animal like or likened to a rib; a costate or costiform process; a long narrow thickening of a surface; a ridge; a strip or stripe; as, (1) one of the veins or nerves of an insect's wing; (2) one of a set or series of parallel or radiating ridges on a shell; (3) one of the ciliated rays or ctenophores of a ctenophore. (b) In ship-building, one of the bent timber or metallic bars which spring from the keel, and form or strengthen the side of the ship.

(c) In archt.: (1) In vaulting, a plain or variously molded and sculptured arch, properly, supporting a vault, or, in combination with other ribs, the filling of a groin or vault. In pointed vaults the groins typically rest upon or are covered by ribs; and secondary ribs connecting the main ribs, especially in late and less pure designs, are sometimes applied, usually as a mere decoration, to the plain surfaces of the vaulting-cells. The three main vaulting-ribs are designated as (a) groin-ribs or ogives, (b) doubleaux, and (c) formerets. (See plan under *arch*.) Ribs upon the surfaces of the cells are known as *surface-ribs*. The groin-rib or ogive is also called the *diagonal rib*, because it occupies the diagonal of the plan of a quadripartite vault. See *arch* and *are*.

All these ribs [of Notre Dame Cathedral, Paris] are independent arches, which determine the forms of, and actually sustain, the vault shells.

C. H. Moore, Gothic Architecture, p. 52.

(2) An arch-formed piece of timber for supporting the coal-and-plaster work of pseudo-domes, vaults, etc. (d) In *lath-mining*, a narrow strip or block of solid coal left to support the workings. (e) One of the curved extension rods on which the cover of an umbrella is stretched.

To guard their Beauties from the sunny Ray.

Gay, Trivia, i.

(f) In bot.: (1) One of the principal vascular bundles, otherwise called *nerves* or *veins*, into which the primary bundle divides on entering the blade to form the framework of a leaf, commonly salient on its lower surface; a primary nerve, contrasted with *vein* and *veinet*, the branches to which it gives origin. See *midrib* and *nerivation*. (2) A prominent line on the surface of some other organ, as the fruit. (g) In cloth or knitted work, a ridge or stripe rising from the groundwork of the material, as in corduroy. (h) In *bookbinding*, one of the ridges on the back of a book, which serve for covering the tapes and for ornament. (i) One of the narrow tracks or ways of iron in which the bed of a printing-press slides to and from impression. (j) In *mach.*, an angle-plate cast between two other plates, to brace and strengthen them, as between the sole and wall-plate of a bracket. (k) In a violin or similar instrument, one of the curved sides of the body, separating the belly from the back. (l) In *gun-making*, either of the longitudinally extending upper or lower projections of the metal which join the barrels of a double-barreled gun, and which in fine guns are often ornamented or of ornamental shape. The upper rib is called the *top rib*; the lower, the *bottom rib*. 3. A piece of meat containing one or more ribs; a rib-piece: as, a *rib* of beef.—4. A wife: in allusion to Eve, who, according to the account in *Genesis*, was formed out of one of Adam's ribs. [Humorous.]

It is of rare occurrence except in English medieval vaulting, and is not used in vaults of the most correct and scientific design.—**Sacral rib**, the pleurapophysis of a sacral vertebra, of whatever character. The very complex sacrum of a bird often bears articulated or ankylotized ribs of ordinary character, called *sacral*, though these may be really lumbar, sacral, or dorsolumbar. No mammal has such sacral ribs; but the whole "lateral mass," so called, of a mammalian sacrum, as in man, which ossifies from several independent centers, is regarded by some anatomists as pleurapophyseal, and therefore as representing a consolidation of sacral ribs.—**Surface-rib**, in *arch.*, a rib without constructive office, applied to the surface of vaulting merely for ornament; a lierne, tierceron, etc. Such ribs, as a rule, were not used until after the best time of medieval vaulting.—**To give a rib of roast**, to rib-roast; thrash soundly. Ricinus¹ (ris'í-nus), *n.* [NL. (Tournefort, 1700), < *L. ricinus*, a plant, also called *cici* and *croton*; perhaps orig. an error for **cicius*, < Gr. *kikavoc*, of the castor-oil plant (*κικαρον έλαιον*, castor-oil), < *κίσι* (> *L. cici*), the castor-oil plant.] A genus of apetalous plants of the order Euphorbiaceæ, tribe *Crotonææ*, and subtribe *Acalyphææ*. It is characterized by monoecious flowers, the calyx in the staminate flowers closed in the bud, in the pistillate sheath-like and cleft and very caducous; by very numerous (sometimes 1,000) stamens, with their crowded filaments repeatedly branched, each branch bearing two separate and roundish anther-cells; and by a three-celled ovary with two-cleft plumose styles, ripening into a capsule with three two-valved cells, each containing one smooth ovoid hard-crusted seed with fleshy albumen and two broad and flat cotyledons. The only species, *R. communis*, the well-known castor-oil plant, is a native probably of Africa, often naturalized in warm climates, and possibly indigenous in America and Asia. It is a tall annual herb, smooth and often clau-

cous, becoming arborescent in warm regions, and bearing large alternate leaves palmately lobed and petiolate. The conspicuous terminal inflorescence is composed of somewhat panicled racemes, the upper part of each formed of crowded staminate flowers, the lower part of pistillate flowers, each short-pedicelled. The plant is very variable in its capsules, which are either smooth or prickly, and in the seeds, which are often mottled with gray and brown markings, and appendaged with a large whitish carnule. The castor-oil plant is not only of medicinal value, as the source of a mild and speedy cathartic, but is one of the most imposing of ornamental plants, and thrives as an annual in temperate climates. It has several garden varieties. Also called *castor-bean* and *palma Christi*. See *castor-oil*; also *arilode* and *carnule*.

R. G. White, Words and Their Uses, p. 193.

rifling (rī'fling), *n.* [*Verbal n. of rifle*, *r.*] 1.

The operation of cutting spiral grooves in the bore of a gun.—2. A system or method of spiral grooving in the bore of a rifle. Whatever may be the form of cross-section in the grooves, the modern practice is to make them, for small-arms, extremely shallow; and, though the rectangular form with sharp angles is still retained, the angles are commonly rounded, this being an easier form to keep clean. Henry's system of rifling, used in most military rifles, has seven grooves; and the grooves make one turn in 22 inches. The grooves are broad, rectangular, and very shallow, with rounded angles, the lands being much narrower than the grooves. This is the system used in the Martini-Henry rifle. The system most in vogue in America for match-rifles is that of a uniform spiral, one turn in 18 inches, with very shallow grooves. With shallow grooves, hardened bullets are required; and the method of shallow grooving, with hardened bullets, is now taking the place of deep grooves and soft bullets, which were characteristic of Whitworth's and Henry's system of rifling. In express-rifles the rifling is very shallow with a slow spiral (one turn in 4 feet to one turn in 6 feet); and six is considered the best number of grooves. The so-called "Metford system" of rifling, used in England for the match-rifles, employs five extremely shallow grooves, each including about 32° of the circumference of the bore, the twist of the spiral increasing toward the muzzle, generally finishing with one turn in 17 inches; but it is part of this system to vary the spiral in different guns according to the character of the powder to be used. In large-bore rifles with shallow circular-arc-bottomed grooves, the grooves are often ten in number, with one turn in 7 feet. A system, still of doubtful expediency, has been introduced, called the *non-fouling system*. In this method the barrel is rifled in its front half only. Some very fine shooting has been done by guns thus rifled. The Whitworth system of rifling is that of a hexagonal bore with spiral faces. It is still retained for ordnance. The projectiles for such rifles are also hexagonal with twisted sides. The Hadden system of rifling for ordnance consists of three spiral grooves of deep elliptical cross-section, into which fit three wings on the front of the shot or shell. Other shapes of grooves are also used for ordnance.—*Ratchet-rifling*, a kind of grooving in gun-barrels in which the grooves have a cross-section closely approximating a right-angled triangle with the hypotenuse at the bottom of the groove, like the spaces between the teeth of a ratchet. It is now used only for inferior guns.

rifling-machine (rī'fling-mā-shēn'), *n.* A machine serving to cut spiral grooves or rifles in the surface of the bore of a small-arm or cannon. For small-arms, the cutter-head is armed with two or more cutters, and the grooves are cut in the pulling stroke of the rifling rod to prevent bending, no work being done on the return stroke. After every stroke the cutter-head or barrel is revolved a certain angular distance (depending on the number of grooves to be cut) by the automatic rotation of the rifling bar, so that the several grooves are successively occupied by each cutter. For cannon, the cutter-head fits the bore exactly, and the cutter projects above its cylindrical surface to a height equal to the depth of the chip to be taken out at each stroke, cutting but one groove at a time. The twist is obtained automatically by means of a rack and pinion. The pinion-wheel is made fast to the cutter-bar, and gears into a rack carrying two or three friction-wheels at one end. These friction-wheels roll upon an inclined guide, curved or straight according as the twist is to be increasing or uniform.

4. In law, that which any one is entitled to have, or to do, or to require from others, within the limits prescribed by law (*Law*); any legal consequence which any person, natural or artificial, is entitled to insist attaches to a given state of facts; the power recognized by law in a person by virtue of which another or others are bound to do or forbear toward or in regard of him or his interests; a legally protectable interest. In this sense things possess no rights; but every person has some rights irrespective of power to act or to compel the acts of others, as, for instance, an idiot, etc., and even the obligations of persons in being, in view of the possibility of the future existence of one not yet in being, are the subject of what are termed *contingent rights*. In this general meaning of *right* are included: (a) the just claim of one to whom another owes a duty to have that duly performed; (b) the just freedom of a person to do as is not forbidden or to omit any act not commanded; (c) the title or interest which one person has in a thing exclusive of other persons; and (d) a power of a person to appoint the disposition of a thing by which he has no interest or title. *Right* has also been defined as a legally protected interest. A distinction is made between *personal* and *real rights*. The former term is often used in English law for a right relating to personal, the latter for a right relating to real property. But in the language of writers on general jurisprudence and on civil law a personal right is a right exclusively against persons specifically determined, and a real right is a right availing against all persons generally. By some writers a distinction is taken between *primary rights* and *sanctioning rights*, by the latter being meant the rights of action which the law gives to protect the primary rights, such as ownership, or contracts.

Absolute rights, those rights which belong to human beings as such; those rights to which corresponds a negative obligation of respect on the part of every one. existing in early mod. E. as *rightwise*, < *ME.*
rihtwis, *rihtwis*, *rihtwis*, *rihtwis*, *rihtwis*,

réttriss), righteous, just; heretofore explained
as lit. 'wise as to what is right,' < *riht*, n., right,
+ *wis*, a., wise; but such a construction of
ideas would hardly be expressed by a mere
compound, and the explanation fails when ap-
plied to the opposite adj. **urawigis*, *ME.* *urawig-*
is, *wrongwise*, *wrongwis*, mod. E. *wrongous*,
which cannot well mean 'wise as to what is
wrong' (though this adj. may have been formed
merely on the external model of *rihtwis*). The
formation is, no doubt, as the cognate OHG.
form *rehtwis*, which has an additional adj.
suffix, also indicates, < AS. *riht*, a., right, just,
+ *wis*, n., way, manner, wise (reduced to -*wis*

= *Syn.* 1. *Righteous*, *rightful*, *upright*, *just*; honest, equi-
table, fair; godly, holy, saintly. The first three of the Ital-
icized words go back directly to the first principles of right,
while *just*, though expressing quite as much conformity to
right, suggests more of the intricate questions arising out
of the relations of men. *Upright* gets force from the
idea of physical perpendicularity, a standing up straight
by the standard of right; *righteous* carries up the idea
of right to the standards, motives, and sanctions of religion;
rightful applies not to conduct, but to claims by
right: as, he is the *rightful* owner of the land; *just* sug-
gests by derivation a written law, but presumes that the
law is a right one, or that there is above it, and if neces-
sary overruling it, a law of God. This last is the uniform
Biblical usage. *Just* generally implies the exercise of some
power or authority. See *justice* and *honesty*.

rigidity (ri-jid'i-ti), n. [= F. rigidité = It. rigidità, < L. rigiditas, < rigidus, rigid: see rigid.]

1. The quality of being rigid; stiffness; inflexibility; absence of pliancy; specifically, in mech., resistance to change of form. In all theoretical discussions respecting the application of forces through the intervention of machines, those machines are assumed to be perfectly rigid so far as the forces employed are able to affect their integrity of form and structure. Rigidity is directly opposed to flexibility, and only indirectly to malleability and ductility, which depend chiefly on relations between the tenacity, the rigidity, and the limit of elasticity.

Whilst there is some evidence of a tidal yielding of the earth's mass, that yielding is certainly small, and . . . the effective rigidity is at least as great as that of steel.
Thomson and Tait, Nat. Phil., § 848.

It is also produced by nervous disturbance or shock. [In this sense always spelled *rigor*.]—Rigor mortis, the characteristic stiffening of the body caused by the contraction of the muscles after death. It comes on more or less speedily according to temperature or climate, and also after death by different diseases, both of which circumstances also influence its intensity and duration. In western Europe the disease has prevailed from time to time since the fourth century in extensive epizootics. From its home on the steppes of eastern Russia and central Asia it has been carried westward by the great migrations and later by the transportation of cattle. The losses in Europe have been enormous. Thus, in 1711-14 1,500,000 heaves are said to have perished, and in 1870-1 30,000 heaves in France alone. The infection (the precise nature of which has not yet been definitely determined) may be transmitted directly by sick animals or indirectly by manure, or by persons and animals going from the sick to the well. It may be carried a short distance in the air. Its vitality is retained longest in the moist condition. The disease, after a period of incubation of from three to six days, begins with high temperature, rapid pulse, and cessation of milk secretion. This latent period is followed by a congestion of all the visible mucous membranes, on which small erosions or ulcers subsequently develop. About 90 per cent. of all attacked die in from four to seven days after the appearance of the disease. If the animal survives, one attack confers a lasting immunity.

Those who in great cities form the committees and work the machine are persons whose chief aim in life is to make their living by office. . . . See *abdominal*.—Annual ring, in bot., one of the concentric layers of wood produced yearly in exogenous trunks. Such rings result from the more porous structure of the wood formed in spring as compared with the autumn growth, a difference attributed to less and greater tension of the bark at the two seasons. In the exogens of temperate regions, on account of the winter rest, these zones are strongly marked; in those of the tropics they are less obvious, but the same difference of structure exists in them with few if any exceptions, save in cases of individual peculiarity. In temperate climates a double ring is exceptionally produced in one season, owing to a cessation and resumption of growth, caused, for example, by the stripping of the leaves. It is a question whether some, especially tropical, trees do not normally form semiannual rings corresponding to two growing seasons. Somewhat similar rings are formed, several in a season, in such roots as the beet. These have no reference to seasons, but result, according to De Bary, from the successive formation of cambium-zones in the peripheral layer of parenchyma. Sir Isaac Newton was the first to investigate them (whence the name).—**Nobili's rings**, concentric colored rings formed on a flat surface about a pointed electrode by the electrolysis of certain salts. Such rings are usually of hyaline cartilage and very elastic, but may ossify more or less completely. They are numerous, closely succeeding one another along the course of the trachea. They are frequently incomplete in a part of their circumference, or otherwise irregular, when, like the corresponding bronchial rings, they are known as *half-rings*. In animals whose necks undergo notable lengthening and shortening in different attitudes of the head, the rings provide for a corresponding extension and contraction of the trachea, as notably in birds, whose tracheal rings are regularly beveled alternately on the right and left sides, so as to slide over one another when the windpipe is contracted in retraction of the neck. (See *cut under trachea*.) Tracheal rings are normally much alike in most of the length of the windpipe, but commonly undergo special modifications at each end of that tube (see *cricoid*, n., and *cut under pes-sulus*); less frequently several rings are enlarged and con-

solidated in a dilatation called the *tympanum*. The word *river* is not connected with the word *rivulet*.] 1. A considerable body of water flowing with a perceptible current in a certain definite course or channel, and usually without cessation during the entire year. Some watercourses, however, are called *river*s although their beds may be almost, or even entirely, dry during more or less of the year. As water must find its way downward, under the influence of gravity, wherever the opportunity is offered, most rivers reach the ocean, which is the lowest attainable level, either independently or by uniting with some other stream; but this process of joining and becoming merged in another river may be repeated several times before the main stream is finally reached. As a general rule, the river which heads furthest from the sea, or which has the longest course, retains its name, while the affluents entering it lose their identity when merged in the larger stream. There are various exceptions to this, one of the most remarkable of which is the Mississippi, which retains that name to its mouth, although the affluent called the Missouri is much longer than the Mississippi and somewhat larger at the junction.

Asia, North America, and South America have "closed basins," or regions in which the surplus water does not find its way to the sea, for the reason that there evaporation is in excess of precipitation, so that the water cannot accumulate to a height sufficient to allow it to run over at the lowest point in the edge of the basin, and thus reach the sea. The water carried by rivers is rain or melted snow, a part of which runs on the surface to the nearest rivulet while the rain is falling, or immediately after it has fallen, while a larger part consists of that rain-water which, falling upon a permeable material, such as sand and gravel, sinks beneath the surface for a certain distance, and then makes its way to the nearest available river, more or less slowly according to the permeability of the superficial material, the extent to which it is saturated with water, and the nature and position of the impermeable beds, as of clay or crystalline rocks, which may underlie it. Were the surface everywhere entirely impermeable, the rainfall would be carried at once to the nearest rivers, and disastrous freshets would be the rule rather than the exception in regions of large rainfall. It is a matter of great importance that many of the largest rivers head in high mountain regions, where the precipitation is chiefly or entirely in the form of snow, which can melt only gradually, so that disastrous floods are thus prevented, while the winter's precipitation in many regions is stored away for summer's use, extensive tracts being thus made available for habitation which otherwise would be deserts. The size of a river depends chiefly on the orographical features and the amount of rainfall of the region through which it flows. Thus, the Amazon is the largest river in the world because the peculiar topography of South America causes the drainage of a vast region (over two million square miles) to converge toward one central line, and because throughout the whole course of that river and its branches there is a region of very large rainfall. The Orinoco, although draining an area less than

one fifth of that of the Amazon, is navigable for fully 1,000 miles, and is, when full, over three miles wide at 500 miles from its mouth, because it drains a region of extraordinarily large precipitation. The Missouri-Mississippi, on the other hand, although draining an area nearly as large as that of the Amazon, is very much inferior to that river in volume at its mouth, because it flows for a considerable part of its course through a region where the precipitation is very small, while it is not extraordinarily large in any part of the Mississippi basin. The area drained by any river is called its *basin*; but this term is not generally used except with reference to a river of considerable size, and then includes the main river and all its affluents. The edge of a river-basin is the watershed, in the United States frequently called the *divide*, and this may be a mountain-range or an entirely inconspicuous elevation of the surface. Thus, for a part of the distance, the divide between the Mississippi basin and that of the Great Lakes is quite imperceptible topographically. Exceptionally some large rivers (as the Amazon and Orinoco) inosculate with each other.

Cotleridge, Cologne.

In speaking of *river*s, Americans commonly put the name before the word *river*, thus: Connecticut *river*, Charles *river*, Merrimack *river*; whereas the English would place the name after it, and say, the *river* Charles, &c. And when English writers copy from our geographers, they commonly make this alteration, as will be seen by referring to any of the English Gazetteers.

It may be navigable or not; the right to use it may be purely public, or it may be private property; it may arise from streams, or constitute the outlet of a lake; it may be known by the appellation of *river* or by some other name — these particulars not being material to its legal character as a river. *Bishop*.

River and Harbor Bill, an appropriation bill generally passed in recent years by the United States Congress, for the improvement of navigable waters, the development of streams, etc., alleged to be suitable for navigation. In 1882, and again in 1896, such a bill was vetoed by the President on account of its extravagance, but it was passed over the veto. The amount appropriated increased from less than \$4,000,000 in 1870 to about \$25,000,000 in 1891; the average for the six years ending June 30, 1896, was \$16,700,000. — **River Brethren**, a denomination of Baptists in the United States, which arose during the Revolution, and derived its origin from the Menomites. rivet¹ (riv'et), *n.* [Early mod. E. also *ryret*, *revert*; *< OF. rivet*, *riveret*, a rivet, also the welt of a shoe, *< river*, clench, rivet, tuck in (bedclothes), F. *river*, clench, rivet; cf. Sc. dial. *riv*, clench (Aberdeen), sew coarsely (Shetland), *< Icel. rifa*, tack together, stitch together (Skeat). (Cf. *river*¹, *v.*)] A short metallic malleable pin or bolt passing through a hole and so fastened as to keep

pieces of metal (or sometimes other substances) together; especially, a short bolt or pin of wrought-iron, copper, or of any other malleable material, formed with a head and inserted into a hole at the junction of two or more pieces of metal, the point after insertion being hammered broad so as to keep the pieces closely bound together. Large rivets are usually hammered or closed up (riveted) when they are in a heated state, so as to draw the pieces more firmly together by the contraction of the rivet when cool. It is in this manner that boilers, tanks, etc., are made. Small rivets are frequently riveted cold. Instead of being closed by hammering, rivets are now often riveted by means of powerful machinery, which makes better joints than can be made by hand, and executes the work far more quickly. In some kinds of metal-work, as armor, the metal pin is movable in a slot, allowing one of the plates of metal to slide over the other for a certain distance. Compare *Almain-rivet*.

riveting-machine (riv'et-ing-ma-shén'), *n.* A power-machine for forcing hot rivets into position in metal-work and heading them. Such machines consist essentially of a die and anvil; and in typical forms of the machine the work to be riveted is supported over the anvil, the hot rivet is put in place in the hole, its end resting in a die-socket in the anvil, and the horizontal die advances, squeezes the rivet into place, and shapes both heads at the same time. Riveting-machines are made in a great variety of forms for both light and heavy work. In some the anvil and die are both movable and are operated by hydraulic power. Some recent machines are portable, and are suspended by chains from a crane, so that the machine can be brought to the work instead of carrying the work to the machine. A recent American machine employs an anvil and a riveting-hammer operated by compressed air and delivering a series of rapid blows instead of a direct pressure, and thus more nearly copies hand-work. Riveting-machines are sometimes named by special names, as the *girder riveter*, *keel riveter*, etc.

It is characterized by a globose and compressed fleshy fruit, and by flowers with a calyx of four small equal segments, four stamens, a short curved style, and capitate stigma. The five enumerated species are reducible perhaps to one, *R. toaria*, a native of tropical and subtropical America, extending into Texas and Florida, introduced in Asia and some African islands. It is an erect smooth or hairy herb with shrubby base, 6 or 8 feet high, or in some forms much smaller, producing many two-forked and two-furrowed branches. It bears alternate slender-petioled thin ovate leaves, and slender pendulous racemes of small reddish-white flowers, followed by red pea-like berries. In the West Indies it is called *hoop-widhe*. The smaller variety, *humilis*, is known as *blood-berry*, also as *rouge-berry* or *rouge-plant*, from a use made of its fruit before it becomes dry. Both plants, especially the latter, are somewhat cultivated for ornament.

They occur in both running and standing fresh water—*R. fluitans*, for example, forming a blue-green scum on stagnant pools; and there are a few species in brackish or salt water.

To cook, dress, or prepare (meats) for eating, originally on a grate or gridiron over or beneath a fire (broiling), but now by exposure to the direct action of dry heat (toasting). Roasting is generally performed by revolving the article on a spit or a string before a fire, with a reflector or Dutch oven to concentrate the heat: in primitive cookery hot ashes serve a similar purpose. Meat cooked over or beneath a fire, on a gridiron, is now said to be *broiled*; and meat cooked in a stove- or range-oven, where it does not receive the direct action of the fire, is properly said to be *aked* (though generally said to be *roasted*).

A strange world where the robin was a little domestic bird that fed at the table, instead of a great fidgety, jerky, whooping thrush. O. W. Holmes, Old Vol. of Life, p. 172.

2. The red-breasted or migratory thrush of North America, *Turdus migratorius* or *Merula migratoria*, one of the most abundant and fa-

American Robin (*Merula migratoria*).

miliar of North American birds: so called from the reddish-brown color of the under parts, which, however, is very different, both in hue and in extent, from that of the European red-breast. This robin is 10 inches long and 16 in extent of wings. The upper parts are slate-color with an olive shade; most of the under parts are chestnut-red; the vent-feathers are white, with dusky markings; the head is black, with white marks about the eyes and white streaks on the throat; and the tail is blackish, usually marked with white at the ends of the outer feathers. The bill is mostly yellow. The robin inhabits the whole of North America; it is migratory, feeds on insects, worms, berries, and other fruits, and breeds at large throughout its range, building a large strong nest of hay and mud on a bough, and laying from four to six uniform greenish-blue eggs, $\frac{1}{2}$ inches long by $\frac{1}{4}$ inch broad. Also, familiarly, *robin-redbreast*.

3. With a qualifying term, one of numerous warbler-like or thrush-like birds, more or less nearly related to or resembling either of the foregoing: as, the blue-throated robin. (See *Cyanocitta*, and cut under *bluethroat*.) Some of these terms are book-names, others are casual transfers of the word *robin* by English residents in various parts of the world, especially India and Australia. In the latter region are various flycatchers (*Muscicapidae*) of the genus *Petrarca* and its subdivisions, some of which are called *robins*, as the scarlet-breasted, *P. multicolor*, peculiar to Norfolk Island. Some of the Asiatic chats of the genus *Pratincola* are known as *Indian robins*; these are related to the British whinchat and stonechat, and do not particularly resemble the true robin of England. Others, recently separated generically under the name *Erythromyias*, inhabit Java, Sumatra, Borneo, and other islands of the same zoogeographical region, and resemble the true robin, as *E. dumetoria* and *E. muelleri*. The red-breasted flycatcher, *Muscicapula (Erythrosterna) parva*, which ranges from central Europe into India, bears a striking resemblance to the true robin. Among other Indian robins, loosely so called, may be noted one sometimes specified as the *water-robin*. This is a flycatcher, *Xanthopygia fuliginosa*, originally described by Vigors in 1831 as *Phoeniceya fuliginosa*, and commonly catalogued as *Ruticilla fuliginosa* (after G. R. Gray); but it does not belong to the same family as the robin, nor to the same genus as the redstart. It inhabits the Himalayan region, and ranges widely in China and India. It has been placed in 5 different genera, two of which, *Rhyacornis* of Blanford and *Nymphæus* of A. O. Hume, were specially framed for its reception.

[Prov. Eng.].—*Golden robin*, the Baltimore oriole, *Icterus galbula*.—*Ground robin*, the chickadee. See *marsh-robin*, and cut under *Pipilo*. [Local, U.S.].—*Maggie robin*, a daisy. It is characterized by a legume with thin valves, winged on its upper margin, and by papilionaceous flowers with a broad reflexed standard, an awl-

shaped inflexed style terminating a stalked and many-ovuled ovary, and surrounding these a long sheath of ten diadelphous stamens, one of them partly, or at length wholly, free. The branchlets and leafstalks are nearly smooth, bristly, or viscid-hairy. The leaves are unequally pinnate with stipulate leaflets, and are furnished with a pair of bristle-shaped stipules, or of short stout spines in their place. The flowers are white or rose-purple, borne in conspicuous racemes. There are 6 or 6 species, 2 of them little-known Mexican trees, the others native in the southern and central United States. Of the latter the chief is *R. Pseudacacia*, the common locust or false acacia, widely planted and naturalized in the Northern States, also much planted in Europe, where it presents several varieties. For this and other species, see *locust*², 1, and *rose-acacia*; also *acacia*, 3.

Strong, Robust, Lusty, Sturdy, Stalwart, Stout, hale, hearty, brawny, mighty, powerful. Strong is the generic term among these, and is the most widely used in figurative applications. By derivation it means having the power of exerting great muscular force. Robust suggests an oaken strength, hence compactness, toughness, soundness of constitution, blooming health, and good size if not largeness of frame. Lusty characterizes the kind of strength that one enjoys possessing, abounding health, strength, vitality, and spirits. Sturdy suggests compactness and solidity even more than robust does; it expresses a well-knit strength that is hard to shake or resist, standing strongly upon its feet. Stalwart suggests tallness or largeness with great strength or sturdiness. Stout is little different from strong; it sometimes means strong to do or to support burdens: as, a stout defender; a stout porter carrying a heavy trunk.

roc (rok), *n.* [Also *rock, rok, roc, ruck, rukh; = G. roc = Sw. roc, rok = Dan. rok = It. rock, rochi (Florida). < Ar. Pers. rukh, a roc. Cf. rock².*] A fabulous bird of prey of monstrous size, famous in Arabian mythology, and corresponding to the Persian simurg. There is no certain basis of fact upon which the myth of the roc rests. The most colossal birds of which we have any knowledge are the dimorphitic moas of New Zealand and the Madagascar aporhithic elephant-birds. The largest known rapacious bird (the roc figures as a bird of prey) is the *Harpagornis*, which may have been able to kill a moa, though certainly not to fly away with one. The most plausible speculation bases the roc on the *Epyornis*. See the quotation.

On the 27th of January, 1861, Edouard Geoffroy Saint-Hilaire read before the Parisian Academy of Sciences a paper, in which he described two enormous eggs and part of the metatarsus of a bird which he called *Epyornis*

marinus. . . This brought again to mind the old story of the famous Venetian traveller, Marco Polo, who located the roc or roc, the giant bird of the Arabian tales, upon Madagascar, and related that the great Khan of the Tartars, having heard of the bird, sent messengers to Madagascar, who brought back a feather nine spans long, and two palms in circumference. Stand. Nat. Hist., IV. 47.

The thallus is fruticose or finally pendulous, alike on both sides, and cartilaginous-coriaceous; the medullary layer is loosely cottony. The species are few and closely related, growing especially in the warmer maritime regions of the earth, and furnishing the famous orchil or orchil of dyers. *R. tinctoria* and *R. fuciformis*, the best-known species, are the chief sources of the dye. See cut under *orchil*; see also *canary-moss, cape-weed, dyer's-moss, flat-orchil, tilimus, Mauritius-weed*.

It is characterized by a salver-shaped corolla with its tube much longer than the small five-cleft calyx, the five stamens united to the petals, and five free carpels, attenuated into elongated and exerted converging styles. The 4 species are natives of South Africa, and are fleshy undershrubs, bearing thick opposite leaves with united bases. The flowers are showy and rather large, white, yellow, scarlet, or rose-colored, and clustered in dense cymes. For these and the singular leaves the species are somewhat cultivated as house-plants. *R. coccinea*, with scarlet flowers, has the name of *coral*, and *R. falcata* is sometimes called *ice-plant*.

2. Eccles., a close-fitting vestment of linen or lawn, worn by bishops and some others. It reaches to the knees or lower, and has close sleeves extending to the wrists, or is sleeveless. The rochet is variety of the alb or surplice, the latter differing from both alb and rochet by the fullness of its sleeves. In the Roman Catholic Church the rochet is worn by bishop and abbots, usually under a manteletta, and, as a choir vestment, by some canons. In the Anglican Church the rochet is worn under the chimere—these vestments constituting the distinctive episcopal habit as ordinarily worn in church and in Parliament and Convocation. The law sleeves are now made very full, and attached to the chimere, not to the rochet.

(= It. rocco, m.), roke, usually assimilated roche (> ME roche, E. obs. roach², q. v.), F. rocche, f., = Pr. rocu, rocha = Sp. roca = Pg. roca, rocha = It. rocca, roccia, < ML. roca, rocca, a rock; prob. o Celtic origin: Ir. Gael. roc = Bret. rock, a rock. According to Diez, prob. < LL. *rupica, or rupca < L. rupes, a rock.] 1. The mass of mineral matter of which the earth, so far as accessible to observation, is made up; a mass, fragment, or piece of that crust, if too large to be designated as a stone, and if spoken of in a general way without special designation of its nature. When there is such special designation, the term *stone* is more generally adopted, as in *building-stone, paving-stone, limestone, freestone*; or the special designation of the material itself may be used without qualification, as *granite, slate, marble*, etc. The unconsolidated stony materials which form a considerable part of the superficial crust, or that which is at or near the surface, such as sand, gravel, and clay are not commonly designated as *rock* or *rocks*; the geologist, however, includes under the term *rock*, for the purpose of general description, all the consolidated material forming the crust, as well as the fragmental or detrital beds which have been derived from it. Rocks are ordinarily composed of two or more mineral species, but some rocks are made up almost entirely of one species: thus granite is essentially an aggregate of quartz, feldspar, and mica, while marble usually consists chiefly of carbonate of lime, and sandstone and quartzite chiefly of quartz. The number of varieties of rock, according to the classification and description of lithologists, is very great. The number of names popularly in use for rocks is small; granite, porphyry, lava, sandstone or freestone, limestone, marble, and slate are terms under one or the other of which by far the largest part of the rocks are commonly classed. (See these words.) More than 600 distinct species of minerals have been described, but a very small number of them occur as essential constituents of rocks of these, quartz, the feldspars, the micas, the minerals of the augite and hornblende group, talc, chlorite, olivin and carbonate of lime, with which often more or less of carbonate of magnesia is associated, form the great bulk of the rocks. But there are several other minerals which are quite commonly found as accessory constituents, and sometimes in masses large enough to be worthy of the designation of *rock*: such are garnet, epidote, various oxides of iron, pyrites, apatite, andalusite, leucite, tomatine, and a few others. Some mineral substances occur in masses of great extent and thickness, but do not play the part of rock-forming minerals: such are salt, gypsum, and the varieties of coal. Rocks are variously classed by geologists. The most general subdivision of them is into *igneous* and *aqueous*; the former are divided into *plutonic* and *volcanic*, according as they have been formed under conditions of depth and pressure, like granite, or have been poured out upon the surface in the manner of lava. The aqueous rocks are also designated as *sedimentary, fossiliferous, or stratified*. The sedimentary rocks in general are believed to be made up of material resulting from the decay and abrasion of igneous masses, since almost all geologists admit that the crust of the earth has cooled from a state of fusion. Part of the stratified deposits, however*

ve been formed through the agency of life, as in the case of the limestones, most of which have been secreted in an aqueous solution by various organisms, and of al, which is the result of a peculiar kind of decay of getable matter. Some rocks have been formed by the uple evaporation of a solution: for instance, rock-salt. In sedimentary rocks are classified for lithological description according to the nature and texture of the materials of which they are made up: they are arranged in e chronological order of their deposition according to e nature of the fossils which they contain. Sedimentary cks have frequently been greatly changed in character y metamorphosis, by which they have been rendered ystalline, and sometimes made so closely to resemble nous rocks that their true character can only with the eatest difficulty be made out.

Tennyson, In Memoriam, Conclusion.

Rocking bob. Same as *balance-bob*.—**Rocking stone**,

a large block of stone poised so nicely upon its point that

a moderate force applied to it causes it to rock or oscillate.

Such stones are most common in regions of granite, and

especially where it has a marked cuboidal jointing. The

quadrangular masses resulting from the weathering of

this granite assume spherical forms, since the edges and

angles waste away more rapidly than the sides, and a

rocking stone is not infrequently the result. There are

several rocking stones in the granite region of Devonshire

and Cornwall, where they are known as *logans*, *loggan-*

stones, or *loggan-rocks*. The best-known of these is near

Castle Treveryn, St. Levan; it is about 17 feet long, and

weighs about 65 tons. "There are seven loggan-rocks in

the parish of Zennor." Woodward, *Geol. of Eng. and Wales*

(2d ed.), p. 606.

The same cause affects granitic cliffs, rounding the surfaces formed by the "joints," and often leaving detached blocks on the brow of the cliff; and they also give rise to the *Rocking Stones* common in granitic districts.

Prestwich, *Geol.*, i. 56.

=**Syn.** 1 and 2. *Rock*, *Shake*, *Spring*, *Roll*. *Shake* expresses a quicker, more sudden, and less uniform motion than the others: as, to *shake* a tree or a carpet; his knees

to *shake*; *Rock* expresses the slow and regular motion to

shook. *Rock* expresses the slow and regular motion to

and fro of a body supported below—as a cradle upon

rockers, or a *rocking* stone—or at the sides. *Spring* ex-

presses the regular and generally slow motion to and fro,

or around and around, of a body supported or held at one

end, generally above: as, the *springing* of a pendulum, a

censer, a sword. *Roll* is sometimes used of an irregular

motion to and fro, suggesting the *rolling* over of a round

log: as, a *rolling* walk; the *rolling* of a ship in the trough

of the sea. The figurative uses of these words are akin

to their literal meanings: a ship *rocks* when the wind is

steady on the aft quarter; it *springs* about its anchor with

the change of the tide; it *shakes* with each blow from a

heavy wave.

basin or hollow in a rock. Such cavities are com-

mon on the exposed surface of the rocks in various

countries, and they are most frequently met with in

granitic regions, especially in Cornwall and Devonshire,

where they have been worn out by atmospheric erosion,

assisted by the tendency to a concentric structure which

granite frequently exhibits. These rock-basins have been,

and still are by some, ascribed to the Druids. On the

Scilly Islands such cavities are common; some are called

devil's *kettles* and *devil's* *pouch-bells*, and one group is known

A which J is used to turn the feed-screw, which, as the latter cannot move vertically, operates in the nut I to raise or lower the cylinder F together with all its attachments; K is the steam-chest and valve-box with bonnets K. A cylindrical tube of pasteboard or metal filled with a mixture of niter, sulphur, charcoal, etc., which, on being ignited at the base, propels the tube forward by the impact of the liberated gases against the atmosphere. Rockets are used for various purposes. (a) In war, when the apparatus generally consists of a sheet-iron case filled with a composition such as is described above, and a head which may be solid, or hollow and filled with a bursting-charge. (b) Life-rockets, used for carrying a line over a wreck, and thus establishing communication between the ship and the shore. The Russian rocket has a short stick attached to the base and armed with a hook which slides in a groove on the under side of the rocket-stand and engages the ring of the chain attached to the line as the rocket leaves the stand. The German system comprises five-centimeter and eight-centimeter rockets and eight-centimeter anchor-rockets, all of which have long chains attached to the rocket-stick at one end and to the line at the other. The English system consists of double Boxer rockets placed end to end in a single metallic case, having a stick fastened to one side of the case. The Hooper rocket is a modification of the Hale war-rocket, and was very unsatisfactory in its results. All these rockets have metallic cases, and are fired by means of fuses. The uncertainty of their flight and their liability to deterioration by transportation and storage have prevented their adoption for life-saving purposes in the United States. (c) Signal- or sky-rockets, pasteboard cylinders filled with nearly

the same composition, but with a conical head containing stars of various ingredients and colors, and a quantity of powder which, when the rocket has attained its greatest height, bursts the cylinder, when the ignited stars spread through the air and cast a brilliant or colored light producing a beautiful effect. These rockets are used in signaling or for mere pyrotechnic display. Rockets are kept point foremost in their flight by means of a stick projecting behind, which acts in the same way as the shaft of an arrow.

To the head of such rockets may be placed petards, balls of fire, grenades, etc., and so may be applied to warlike affairs. *Mathematical Recreations* (1674).

2. The lever by which a forge-bellows is inflated.—**Congreve rocket**, a large rocket having a shell of sheet-iron and carrying charges of canister-shot, bullets, and other missiles. Sir William Congreve, who first introduced this weapon into warfare, and from whom its name is derived, caused sizes to be constructed ranging from 12 to 32 pounds, with sticks for the larger sizes 20 feet in length. The first notable use of Congreve rockets was at Copenhagen in 1807, and among the then-existing means of attack it proved a very formidable weapon. The composition used in these rockets is saltpetre, sulphur, and charcoal; and they sometimes have a metal head loaded with a bursting-charge very destructive in a fortress or town. Modern improvements in ordnance have supplied more efficient means of attack, and rockets are now used in warfare chiefly as a means for signaling.

rococo (rō-kō'kō), *n.* [*< F. rococo*, appar. a made word, based perhaps, as usually explained, on *rocaille*, rockwork (on account of the

rockwork which figures in the style), *< rocche* (ML. *roca*), a rock; see *rock*.] A variety of ornament originating in the Louis-Quatorze style and continuing with constantly increasing inorganic exaggeration and extravagance throughout the artistic degeneracy of the Louis-Quinze. It is generally a meaningless, though often a very rich, assemblage of fantastic scrolls and crimped conventional shell-work, wrought into irregular and indescribable forms, without individuality and without expression apart from its usually costly material and surroundings. The style has a certain interest from its use in a great number of sumptuous European residences, and from its intimate association with a social life of great outward refinement and splendor. Much of the painting, engraving, porcelain-work, etc., of the time has, too, a real decorative charm, though not of a very high order in art. Hence *rococo* is used attributively in contempt to note anything feebly pretentious and tasteless in art or literature. Compare *baroque*.

The jumble called *rococo* is, in general, detestable. A parrot seems to have invented the word; and the thing is worthy of his tawdriness and his incoherence.

(e) A long, light, tapering, elastic pole used in angling, to which the line is attached, now usually made in adjustable sections or joints, and fitted with guides and a reel. There are eight woods commonly used for rods, of which four are solid (greenheart, hickory, ash, and willow) and four are hollow (East Indian bamboo, Carolina and West Indian cane, white cane, and jungle-cane). Rods have also been made of hard rubber and of steel. Jointed rods are made in three or four pieces, of which the largest and heaviest is the butt, and the slenderest is the tip. The joints are fitted with metal rings or ferrules, and with small rings called *guides* to receive the line. The reel is stepped into the butt, near its end, or otherwise suitably attached, as by a reel-plate. The special makes of rods are very numerous, and their names almost equally so. Besides being named and classed according to the material

of which they are composed, as *bamboo rod*, etc., they are commonly identified with the name of the fish for which they are specially designed: as, *salmon-rod*, *trout-rod*, *bass-rod*, etc. All rods are, however, divisible into three classes, according to their make and purpose. These are (1) the *fly-rod*, which is long, slender, tapering, tough, and highly elastic; (2) the *trotting-rod*, which is comparatively short, stout, and stiff; and (3) the *bait-rod*, which is a mean between the other two. Fly-rods are most used, with artificial flies. Split-bamboo rods are now manufactured for all kinds of angling. See *fly-rod*, and cut under *reel*. (f) An instrument for measuring.

2. In *mech.*, any bar slender in proportion to its length, particularly such a bar used as a brace or a tie between parts for connecting them, or for strengthening a connection between them. The term is used in a very indefinite manner, depending entirely upon individual judgment or caprice. What some would call a rod would by others be called a bar.

See cut under *palatohyoid*. Also called *Meckel's cartilage*.—Napier's rods (or bones), a contrivance, commonly attributed to John Napier (1550–1617), but in fact described in the Arithmetic of Oronce Finck (1532), for facilitating large calculations in multiplication or division for those who do not perfectly know the multiplication table. It consists of a number of rods made of bone, ivory, horn, wood, pasteboard, or other convenient material, the face of each of which is divided into nine equal parts in the form of little squares, and each part, with the exception of the top compartment, subdivided by a dexter diagonal line into two triangles. These nine little squares contain the successive multiples of the number in the first, the figures in the tens' place being separated by the diagonal line from that in the units' place. A sufficient number of rods must be provided for each of the headings 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, so that by placing the proper rods side by side any number may be seen at the top, while the several multiples occupy, in order, the eight lower compartments; when the multiple consists of two figures these are placed one on each side of the diagonal line. There is also a rod called the *index rod*, the squares on which are not subdivided into triangles. To multiply, for example, the number 6789 by 56: Place four of the rods together, so that the top numbers form the multiplicand; then look on the index-rod for 6, the first number of the multiplier, and on the corresponding compartments of the four rods the following disposition of figures will be found ranged in the two lines formed by the triangles of each square.

rodentia (see *animalia*), neut. pl. of *rodens* (t)-s,
ppr. of *rodere*, gnaw; see *rodent*.] An order
of mammalian placental diphyodont *Mam-
malia*, the gnawers. The brain has a relatively small
cerebrum, leaving much of the cerebellum and olfactory
lobes exposed, and the corpus callosum has no well-defined
stream in front. The placenta is discoidal-declinate.
The bones are a subtoral, variously modified for run-
ning, leaping, climbing, or swimming. The condyle of
the lower jaw has its long axis longitudinal, and is not
concerned in a special socket, but glides back and forth,
so that the lower jaw can be put forward and backward
as well as moved up and down. The molar teeth are
typically ridged on their crowns in various patterns;
they are nearly always 14 in number above and below on
each side. The premolars are small or few, often none.
There are no canines. The incisors are large, strong,
have a rounded, bevelled front surface, sculpiform or
bevelled sharp edge, and grow continually from per-
sistent pulp chambers. Their roots traverse much or nearly
all the length of either jaw, in the arc of a circle. The
total number of incisors is 2 above and below, or one

rodentia. In order to fit teeth, exceptionally, as in the *Hystricidae*, are small supplementary upper incisors, which are joined together and extend behind the main pair. In some groups, as *Arviculinae*, the molar is essentially like the incisors. There being no gap between the front and the back teeth, the number of teeth is 1, which obtains with few exceptions throughout the marine series of rodents; in the hystricine series there are only 12; in the leporine series there are usually 20 to 22. In the sciurine series there are usually 20 to 28. This order is by far the largest in the mammalia and of world-wide distribution; its numerous members are adapted to every kind of life. They are mostly of small size, a rabbit being far above the average; the beaver, porcupine, or coypu is a very large rodent, and the capibara is a giant. The order is divided into 3 suborders: (1) *Hebeldentata*, enamel or blunt-toothed rodents, exceptional in having 4 lower incisors, and extinct; (2) *Duplicidentata*, subnormal or double-toothed rodents, with 1 upper incisor; these are the hares, rabbits, and pikas; and (3) *Simplicidentata*, normal or single-toothed rodents, with only 2 incisors above and below. The last fall in 3 series: (1) *Hystricimorpha*, the hystricine series, including the porcupines and a very numerous related forms, chiefly South American, as the capibara, coypu, cavies, viscachas, chinchillas, etc.; (2) *Sciuromorpha*, the sciurine series, or the squirrels, spermophiles, marmots, beaver, etc. (see cuts under *Arctomys*, beaver, and prairie-dog). In addition, the *Duplicidentata* rodents are (4) *Lepuromorpha*, the leporine series, the same as the suborder *Duplicidentata*. (See cut under *Lepus*.) Many fossils of all these groups are known. There are 20 or 21 families of living rodents, and 100 genera. The order corresponds to the Linnean *Glires*, and is still often called by that name. Also called *Rosacea*. See cuts under *Castor*, *Leporidae*, and *Scatipiform*.

Such rolling-mills sometimes bear special names, as a rail-mill, wire-rolling mill, etc. The essential feature of a rolling-mill is a set or train of steel rollers placed either in pairs one over the other, as in a two-high train, or in a group of three, as in a three-high train. The heated metal direct from the furnaces is presented to these rollers and is drawn through between the trains. It is at once caught on the other side and repassed between the rollers, each passage between them being called a *pass*. In a two-high train the rollers are stopped and reversed at each pass. In a three-high train the rollers turn constantly in one direction, the return pass being between a different pair of rollers from the pair first passed through, the mid-

dle roller, however, always being one of either pair. The distance between the rollers is regulated by screws at the ends. The section given to the metal in passing through the rollers is determined by the shape of the rollers, whether flat or grooved, it being possible to produce in this way bars having a great variety of sections adapted for independent or structural uses. The rolling mill serves also to some extent to clear the metal passing through it from impurities. Small rolling-mills with tapering rollers are used to roll short flat metal bars into angles, the passage between the rollers expanding the outside more than the inside edge, and thus causing the strip to assume a curved form. See *cut* under *rod*, 2 (a).

privileges, and gifts, as the supreme ruler, pastor, and teacher of the whole Catholic Church. Ecclesiastically, it is a hierarchy consisting of priests, bishops, and archbishops, presided over by the Pope, who is the supreme head of the church, and who is elected for life by the College of Cardinals from their own number. Every priest receives his consecration from a bishop or archbishop, and every bishop and archbishop holds his appointment from the Pope, by whose permission he must be consecrated. Celibacy is strictly enforced on the clergy. The doctrines of the church are contained in the decrees of the Council of Trent, and in a briefer form in the creed of Pius IV. (1564). This creed contains twelve articles, including an acceptance of the traditions and constitutions of the church and of the Scriptures for the salvation of mankind, though not all for every individual—namely, baptism, confirmation, eucharist, penance, extreme unction, orders, and matrimony; the doctrines concerning original sin and justification defined by the decrees of the Council of Trent; the mass as a true propitiatory sacrifice; the real presence and transubstantiation; purgatory; the invocation of the saints; the veneration of images; indulgences; and the supremacy of the Pope. The last article, as since defined by the Vatican Council, involves the infallibility of the Pope. The worship of the Roman Catholic Church is an elaborate ritual, the central feature of it being the sacrifice of the mass, in which the real body and blood of Christ are believed to be corporeally present, each repetition of the mass being regarded as a real sacrifice for sin and as exercising a real efficacy in securing the salvation of those who in faith assist at and partake of it. These doctrines and usages are, with some differences, largely also those of the Greek and some other churches. The most distinctive doctrines of the Roman Catholic Church are the papal supremacy and infallibility, the immaculate conception, and the purgatorial fire. Communion is given in one kind only.—**Roman Catholicism**, the principles, doctrines, rules, etc., of the Roman Catholic Church collectively.—**Roman Catholic Relief Acts**, a series of English statutes of 1829, 1833, 1834, 1843, 1844, and 1846, removing the political disabilities of Roman Catholics.—**Roman cement**. Hence, we speak of **Roman** power, fortitude, administration; the **Roman** church; the **Latin** language. Nearly all the use of **Latin** has grown out of its application to the language: as, **Latin** grammar; a **Latin** idiom; the **Latin** Church. The words are not interchangeable.

the chancel, or over the rood-screen. The front of the loft, like the screen below, was usually richly ornamented with tracery and carvings, either in wood or in stone. It was often approached by a small staircase in the wall of the building. This feature does not appear in modern churches, and has now been removed from a large proportion of the medieval churches. The rood-loft originated from a combination of the rood-beam and ambo. The center was used as ambo (jube), and the epistle and gospel were read and announcements made from it. It was placed over the entrance to the choir, so that both could stand in the middle line (longitudinal axis) of the church, and the approach to it was made from the side of the church along a broadened rood-beam or loft crowning the rood-screen. Cf. Icel. rāf, also rāfr, mod. rafr, a roof; Russ. krov, a roof; perhaps akin to Gr. κρυπτεν, hide (see *crypt*).] 1. The external upper covering of a house or other building. Roofs are distinguished*

(1) by the materials of which they are mainly formed, as thatch, stone, wood, slate, tile, iron, etc., and (2) by their form and mode of construction, in great variety, as shed, curb, hip, gable, pavilion, ogee, and flat roofs. The span of a roof is the width between the supports; the rise is the height of the ridge between the supports; the pitch is the slope or angle at which it is inclined. In carpentry, *roof* signifies the timber framework by which the roofing or covering materials of the building are supported. This consists in general of the principal rafters, the purlins, and the common rafters. The principal rafters, or principals, as they are commonly termed, are placed so as to span the building at intervals usually of 10 or 12 feet; the purlins lie horizontally upon these, and sustain the common rafters, which carry the covering of the roof. The accompanying figure shows one of

the two varieties of principals which are in common use (the king-post principal), with the purlins and common rafters in position. (For a diagram of the second, the queen-post principal, see *queen-post*.) Each of these modes of framing constitutes a truss. Sometimes, when the width of the building is not great, common rafters are used alone to support the roof. They are in that case joined together in pairs, nailed where they meet at the top, and connected by means of a tie at the bottom. They are then termed *couple*, a pair forming a *couple-close*. See also cuts under *hammer-beam*, *hip-roof*, *jerkin-head*, *M-roof*, *pendent*, and *pendentive*.

Such roofs are frequent in the East, where they are usually thickly covered with clay or mortar. (b) A roof but slightly inclined for the discharge of water. Roofs of this form are common in city buildings, especially in the United States, and are usually covered with sheet metal. **French roof**, a form of roof with almost vertical sides, sometimes concave or even convex, and the top usually flat or sloping toward the rear. The sides are commonly pierced with dormer or other windows. This form of roof spread through-

out the United States about 1870 and in succeeding years. It has its name from its fancied resemblance to the French Mansard roof—its object, like that roof, being to gain space in the topmost story.—**Imperial roof**. See *imperial dome*, under *imperial*. **Mansard roof**, a form of curb-roof the lower slope of which approaches the vertical, while the upper slope is variable, but much more nearly flat than in the typical curb-roof. Formerly the ordinary three-stranded right-hand rope was called *hawser-laid*, and the nine-stranded cable-laid, and they will be found so distinguished in books; but among seafaring men now the terms *hawser-laid* and *cable-laid* are applied indiscriminately to nine-stranded rope, and the three-stranded, being the usual kind of rope, has no particular name, or is called *right-hand rope*. See *cut under cable-laid*.—**Cat-block** rope. See *cat-block*.—**Clue-rope**, a rope fastened to the clue of a course and used as a temporary tack or sheet.

Shak., *C. of E.*, iv. 1. 16.

Shroud-laid rope, rope made by laying four strands together right-handed; it takes its name from the use to which it is frequently applied. All four-stranded rope is made with a central strand called a *heart*, which assists in keeping the others in place.

They are extensively used in raising and lowering apparatus in coal-mines, as standing rigging for ships, as substitutes for chains in suspension-bridges, for telegraph-cables, etc.

Among these are the Scotch roses, derived from the bar-net-rose, *R. spinosissima* (R. *pimpinellifolia*), a low bush of temperate Europe and Asia; the cinnamon- and damask-roses; the Provins, hundred-leaved, or cabbage rose, *R. centifolia*, among whose numerous varieties are most of the moss-roses; and the French or red rose, *R. Gallica*, prolific of variegated and other varieties. These are old favorites, now giving way to the next class. (3) The so-called hybrid perpetuals or autumn roses, best called *remontants* (see *remontant*), as blooming not perpetually, but a second time after rest. The characteristic element in this group is from the China or Indian rose, *R. Indica*. They are large, brilliant, and hardy, afford the great fancy roses of the rosarians, and include such varieties as the *Beroune Prénot*, *General Jacqueminot*, and *giant of battles*. The Jacqueminot is forced in immense quantities for the market. (4) Roses blooming continuously. Here may be classed the *Bourbons*, originating in a cross between the China and a damask variety, a rather tender race, including the *Souvenir de Malmaison*, a famous standard. More constant bloomers are varieties of the China rose known popularly as *monthly roses*, also called *Bengal roses*; the flowers are brilliant and abundant; the plant multiplies readily, and is the best for house culture. Another race of perpetuals is the *noisette*, derived from the musk- and the tea-rose, mostly climbers. Lastly, here belong the tea-roses, or tea-scented roses, descended from var. *odorata* of the China rose, a race of numerous and increasing varieties, most extensively cultivated. The large yellow *Maréchal* (or *Marshal*) *Niel*, highly popular for forcing, is by some classed as a tea-rose, by others as a *Noisette*. In England roses called *standards* are produced by budding the desired variety on the stock of the common dogrose, or of a vigorous variety known as *Manetti*; in the American climate most sorts do better on their own stock. The rose in culture has numerous enemies, as the rose-aphis or greenfly, the rose-beetle, the rose-slug, and the red-spider. The most important economical use of the rose is in the manufacture of attar or oil of roses. (See *attar* and *rose-water*.) The petals of the red or French rose are slightly astringent and tonic, and are used in various official preparations, chiefly as a vehicle for stronger tonic astringents. The petals of the cabbage-rose are slightly laxative, but are used chiefly in making rose-water. The bright-red hip of some wild roses is ornamental and sometimes edible; that of the dogrose is used to make a confection. The rose is a national emblem of England.

6. In *her*, a conventional representation of the flower, composed of five leaves or lobes, or, in other words, a kind of cinquefoil: when the five spaces between the leaves are filled by small pointed leaves representing the calyx, it is said to be *barbed*. (See *barb*¹, *n.* 8.) The center is usually a circle with small dots or points of a different tincture, usually *or*. These may be supposed to represent the stamens, but they are called in heraldry *seeds*, and when they are of a different tincture the rose is said to be *seeded*.

7. In *arch*, and *art*: (a) A rose-window. (b) Any ornamental feature or work of decorative character having a circular outline: properly a larger and more important feature or work than a rosette or a circular boss.—8. A rosette, as of lace.—9. In *zoöl.*, a formation suggestive of a rose; a radiating disposition or arrangement of parts: a rosette, as that formed at the parting of feathers on the heads of domestic pigeons of different breeds, or that represented by caruncles about the eyes or beak. In musical instruments like flutes, guitars, dulcimers, and harpsichords, an ornamental device set in the sound-hole of the belly, and often serving as a trade-mark as well as a decoration.—16. A form in which precious stones, especially small diamonds, are frequently cut. Large rose diamonds were much used from the sixteenth to the eighteenth century, but are now quite obsolete. The characteristic of the rose is that it is flat below, and forms a hemispheric or low pyramid above, covered with small facets. When, as is usually the case, these facets are 24 in number, the cut is called a *Dutch rose*; when 36, a *rose coupée*. The *Brabant rose* has also 24 facets, but they are flatter or less raised than in the Dutch rose. The rose cut is selected when the loss to the stone in cutting would be too great if the brilliant cut were selected. Rose diamonds are generally cut from plates cleaved from the crystals of diamonds while being cleaved into brilliant form. See *brilliant*.

17. A very small diamond, scarcely more than a splinter, of which as many as 400 are sometimes necessary to make a carat, or 60,000 to make an ounce. These are seldom regularly cut, 6 to 8 facets only being the usual number.—**Alpine rose**, *Rosa alpina* of European mountains, to which are commonly referred the Boursault roses. rosewood (rōz'wūd), *n.* 1. The wood of various Brazilian trees, especially of *Dalbergia nigra*. It is a fine hard cabinet-wood of a chestnut color streaked with black, or varying in the different sorts, and used chiefly in veneers. The name is due to the faint rose-scent of some kinds when freshly cut. Other species of *Dalbergia*, species of *Jacaranda*, and perhaps of *Machaerium*, produce the rosewood of commerce. The woods known as *kingwood* and *violet-wood* may be considered as varieties. See *palisander*, the several generic names, and the phrases below.

rosin (rōz'in), *n.* [*Formerly also rozin; a var. of resin: see resin.*] 1. Same as *resin*. Specifically—2. Resin as employed in a solid state for ordinary purposes. It is obtained from turpentine by distillation. In this process the oil of the turpentine comes over, and the rosin remains behind. Rosin varies in color from dark brown or black to white, according to its purity and the degree of heat used in its preparation. Chemically it is the anhydride of abietic acid. It has the physical and chemical properties common to all resins. It is used in common varnishes, is combined with tallow to make common candles, is used by foundries to give tenacity to their cores, by tinner and plumbers as a flux for their solder, for rubbing on violins, and for many other purposes. Also called *colophony*.

The only species, *R. officinalis*, the rosemary (which see), is native through the Mediterranean region, and cultivated elsewhere, but is not hardy in America north of Virginia. It is a low-branched evergreen aromatic shrub, 4 or 5 feet high, bearing linear entire opposite leaves which are sessile, thickish, about one inch long, smooth and green above, with revolute margins, and white with stellate hairs beneath. To undergo natural decomposition; fall into a course or a state of elemental dissolution; suffer loss of coherence from decay: used of organic substances which either do or do not putrefy in the process, and sometimes, by extension, of inorganic substances.

Milton, Lycidas, l. 127.

=**Syn. 1.** *Rot*, *Decay*, *Putrefy*, *Corrupt*, *Decompose*. *Rot* is, by its age and brevity, so energetic a word that it is often considered inelegant, and *decay* is used as a softer word. That which *rots* or *decays* may or may not emit a foul odor, as an egg or an apple; *putrefy* by derivation implies such foulness of odor, and hence is especially applied to animal matter when it is desired to emphasize that characteristic result of its rotting. *Corrupt* is sometimes used as a strong but not offensive word for thorough spoiling, that makes a thing repulsive or loathsome. To *decompose* is to return to the original elements; the word is sometimes used as a euphemism for *rot* or *putrefy*. The moral uses of the first four words correspond to the physical.

II. *trans.* 1. To cause decomposition in; subject to a process of rotting; make rotten: as, dampness *rots* many things; to *rot* flax. See *ret¹*. Sometimes used imperatively in imprecation. Compare *rat³*, *drat²*.

2. To produce a rotting or putrefactive disease in; specifically, to give the rot to, as sheep or other animals. See *rot*, *n.*, 2.

rot (rot), *n.* [Early mod. E. also *rott*; *< ME. rot, rott, rote, rotte* = MD. *rot*, rottenness: see *rot*, *v.*] 1. The process of rotting, or the state of being rotten; also, rotted substance; matter weakened or disintegrated by rotting.

I will not kiss thee: then the rot returns
To thine own lips again. Shak., T. of A., iv. 3. 63.

2. A condition of rottenness to which certain animals and plants are liable, as the sheep and the potato (see *potato*), attended by more or less putrescence. (a) The rot in sheep, which sometimes affects other animals also, is a fatal distemper caused by the presence of a great number of entozoa, called liver-flukes (*Distoma hepaticum*), in the liver, developed from germs swallowed with the food. The disease is promoted also by a humid state of atmosphere, soil, and herbage. It has different degrees of rapidity, but is generally fatal. (b) In botany *rot* is a general term somewhat loosely applied to cases of the breaking down of the tissues of plants by the destructive agencies of fungi, especially saprophytic fungi and bacteria, but also parasitic fungi. The attacks of parasitic forms, the punctures of insects, and mechanical injuries to plants are frequently followed by decay or rot, since these accidents permit the introduction of bacteria, which are very active agents. The rot may be either "dry" (see *dry-rot*) or "wet"—that is, it may or may not be accompanied by moisture: both kinds may be seen in the potato-rot, which is caused by the fungus *Phytophthora infestans*. The so-called black rot of the grape is caused by *Phoma uvice*, the white rot by *Coniophthora diplodictia*, the brown rot by *Peronospora viticola*, and the bitter rot by *Greenerya fuliginea*. The brown rot of the cherry is caused by *Monilia fructigena*. See *potato-rot*, *Phytophthora*, *grape-rot*, *Phoma*, *Peronospora*.

When a single rotary valve is used both for induction and for exduction, and actuated by a single eccentric rod connected with a rocker-arm rigidly attached to the eccentric, the valve, the principles of this valve-motion are precisely the same as those of the common slide-valve motion, the point of cut-off depending upon angular advance of the eccentric rod lap, and the admission being influenced by lead as in the slide-valve. cells, as in *Chara* and *Fallisneria*. See below.—3. Serial or recurrent order; a round or sequence of one after another; a fixed or definite routine of succession; regularly recurring change.

I have often observed particular words and phrases come much into vogue. . . . This has lately been remarkable of the word *rotation*. . . . Nothing is done now but by *rotation*. . . . [In] whilst, they play the rubbers by *rotation*; a fine lady returns her visits by *rotation*; and the parson of our parish declared yesterday that . . . he, his curate, the lecturer, and now and then a friend, would for the future preach by *rotation*.

British Mag., 1763, p. 542, quoted in N. and Q., 7th ser., [VII. 164.]

Angular velocity of rotation. When a solid body revolves about an axis, its different particles move with a velocity proportional to their respective distances from the axis, and the velocity of the particle whose distance from the axis is unity is the angular velocity of rotation. It is often expressed as in turns per second.—**Axial rotation.** See *axial*.—**Axis of rotation.** See *axis*.—**Center of rotation,** the point about which a body revolves. It is the same as the center of motion.—**Center of spontaneous rotation,** the point about which a body all whose parts are at liberty to move, and which has been struck in a direction not passing through its center of gravity, begins to turn. If any force is impressed upon a body or system of bodies in free space, and not in a direction passing through the center of gravity of the body or system, a rotary motion will ensue about an axis passing through the center of gravity, and the center about which this motion is performed is called the *center of spontaneous rotation*.—**Circular rotation of the eyeball,** rotation about the visual axis.—**Congruency of rotations.** See *congruency*.—**Couple of rotations.** See *couple*.—**Energy of rotation.** See *energy*.—**Magnetic rotation of currents.** See *magnetic*.—**Magnetic rotation of the plane of polarization.** See *magnetic rotatory polarization*, under *rotatory*.—**Method of rotations,** a method used in descriptive geometry, consisting in turning a part of the given geometrical system about an axis, usually perpendicular to a plane of projection.—**Principal axes of rotation.** If a point which is not the center of gravity be taken in a solid body, all the axes which pass through that point (and they may be infinite in number) will have different moments of inertia, and there must exist one in which the moment is a maximum, and another in which it is a minimum. Those axes in respect of which the moment of inertia is a maximum or minimum are called the *principal axes of rotation*. In every body, however irregular, there are three principal axes of rotation, at right angles to each other, on any one of which, when the body revolves, the opposite centrifugal forces counterbalance each other, and hence the rotation becomes permanent.—**Principle of the composition of rotations,** the proposition that three rotations about axes which meet in one point are equivalent to one rotation round an axis through the same point, the measure of the rotations being taken upon the axes, and the axis of the resultant rotation being the diagonal of the parallelepiped of which the others are sides.—**Pure rotation,** rotation without translation; a screw-motion where the pitch of the screw vanishes.—**Rotation in office,** the holding of the same office by different persons in succession; specifically, in *politics*, the transfer of offices, especially those filled by appointment, to new incumbents at more or less regular intervals, without regard to the manner in which their duties have been discharged. In the United States the principle of rotation in appointive offices has been both advocated and condemned with great urgency on grounds of public advantage and partisan or personal right.

Jefferson would have rotation in office.

Theodore Parker, Historic Americans, p. 260.

Rotation of crops, a recurring series of different crops grown on the same ground: the order of recurrence in cropping. It is found that the same kind of crop cannot be advantageously cultivated on the same soil through a succession of years, and hence one kind of crop is made to succeed another in repeated series. Different soils and climates require different systems of rotation, but it is a recognized rule in all cases that culmiferous crops ripening their seeds should not be repeated without the intervention of pulse, roots, herbage, or fallow.—**Rotation of protoplasm,** in *bot.*, the circulation or streaming movement of the protoplasmic contents of active vegetable cells. Under a moderately high power of the microscope the protoplasm of vitally active cells is seen to be in a state of constant activity or rotation—that is, it flows or moves about in steady streams or bands in various directions inside the cell. These moving protoplasmic bands have embedded in them minute granules. The rate of the movements varies in different plants, being (at a temperature of 15° C.) only .009 millimeter per minute in the leaf-cells of *Potamogeton crispus*, and 10 millimeters per minute in the plasmodium of *Didymium Sargula*. See *protoplasm*.—**Rotation of the plane of polarization.** See *rotatory polarization*, under *rotatory*.

rotational (rō-tā-shōn-ā), *a.* [*< rotation + -al.*] Pertaining to or consisting in rotation; of the nature of rotation: as, *rotational velocity*.

We should thus be led to find an atom, not in the rotational motion of a vortex-ring, but in irrotational motion round a re-entering channel.

W. K. Clifford, Lects., I. 242.

Rotational motion of a fluid. See *vortex-motion*.—**rotation-area** (rō-tā-shōn-ā-rē-ā), *n.* Double the sum of the products obtained by multiplying each element of mass of a material system by the differential coefficient relative to the time of the area described by the radius vector upon the plane perpendicular to the axis of rotation. If all the external forces which act upon a system are directed toward an axis, the rotation-area for that axis will be described with a uniform motion, which is the principle of the conservation of areas.

The *rotation-area* for an axis may be exhibited geometrically by a portion of the axis which is taken proportional to the area, and it is evident from the theory of projections that *rotation-areas* for different axes may be combined by the same laws with which forces applied to a point and rotations are combined, so that there is a corresponding parallelepiped of *rotation-areas*. There is, then, for every system, an axis of resultant *rotation-area*, with reference to which the rotation is a maximum, and the *rotation-area* for any other axis is the corresponding projection of the resultant *rotation-area*. The *rotation-area* vanishes for an axis which is perpendicular to the axis of resultant *rotation-area*.

In former times the *royal* household included all the chief officers of state, who were regarded as merely the king's servants, and often performed menial duties toward him; afterward, only persons who had special functions relating to the royal needs, dignity, or prerogatives. In the British *royal* household, as it has existed for several centuries, the chief officers are the lord steward, lord chamberlain, and master of the horse, who are always peers and members of the government of the time. Under each of them are many subordinate officers, among whom the different branches of their duty are distributed. Independent of them are the private secretary and the keeper of the privy purse to the sovereign, modern additions to the household, with their subordinates. When there is a queen consort, the queen's household is a separate establishment, similarly though less elaborately organized. On the accession of Queen Victoria the expenses of the *royal* household were permanently fixed at £303,700 per annum.—**Royal** letter. See *letter*, 3.—**Royal** marines. See *porcelain*.—**The** *royal* doors or gates. See *door*.—**Syn.** *Royal*, *Regal*, *Kingly*. *Regal* is applicable primarily to what pertains to a king in virtue of his office, and hence to what is proper to or suggestive of a king, and as now frequently used is nearly synonymous with *princely*, *magnificent*: as, *regal* state or pomp; *regal* power. *Royal* notes what pertains to the king as an individual, or is associated with his person: as, his *royal* highness (applied to a prince of the blood); the *royal* family; the *royal* presence; the *royal* robes; a *royal* salute. It does not, like *regal*, necessarily imply magnificence. Thus, a *royal* residence may not be *regal* in its character, while on the other hand any magnificent mansion belonging to a subject may be described as *regal*, though it is not *royal*. The sway of a great Highland chief of old was *regal*, but not *royal*. Hence, in figurative use, *royal* is applied to qualities, actions, or things which are conceived of as superlatively great, noble, or admirable in themselves, or as worthy of a king; as, a *royal* disposition, *royal* virtues, a *royal* entertainment, etc.; *regal*, to those which make an impression of the highest grandeur, stateliness, ascendancy, or the like: as, a *regal* bearing, *regal* munificence, *regal* commands, etc. *Kingly* seems to be intermediate. It signifies literally like a king, hence proper to or befitting a king and in its more general use resembling or suggestive of a king. Like *royal*, it has reference to personal qualities: as, a *kingly* bearing, presence, disposition, and the like; while, like *regal*, it is not restricted to the monarch or members of his house.—3. Col. ii. 8.

To learn the order of my flustering,
I must begin with rudiments of art.
Shak., T. of the S., iii. 1. 60.

3. In *biol.*: (a) That which is rudimentary; that which is in its first or an early stage of development, which may or may not be continued; the beginning or foundation of any part or organ: as, the rudiment of the embryo which is to go on to maturity; the rudiment of an organ whose further development has been arrested or aborted. (b) That which is vestigial; a vestigial or aborted part, organ, or structure; an abortion; a vestige. = Syn. 3. *Petus*, Germ, etc. See *embryo*.

rudiment (rō'di-ment), *r. t.* [< *rudiment*, *n.*] To furnish with first principles or rules; ground; settle in first principles.

It is the right discipline of knight-errantry to be rudimented in losses at first, and to have the tyrocinium somewhat tart.
Gayton, Notes on Don Quixote, p. 87.

rudimental (rō-di-men'tal), *a.* [< *rudiment* + *-al*.] Pertaining to or of the nature of rudiments; rudimentary.

Your first rudimental essays in spectatorship were made in my shop, where you often practised for hours.
Spectator.

rudimentarily (rō-di-men'ta-ri-li), *adv.* In a rudimentary manner or state; elementarily.

Every such event brings him [man] into relation with the unknown, and arouses in him a feeling which must be called rudimentarily religious.
Mind, X. 22.

rudimentary (rō-di-men'ta-ri), *a.* [F. *rudimentaire* = Sp. *rudimentario* = Pg. *rudimentar*; as *rudiment* + *-ary*.] 1. Pertaining to rudiments or first principles; consisting in or dealing with first principles; elementary; initial: as, rudimentary teachings; rudimentary laws.—2. Of the nature of a rudiment; elementary; undeveloped.

It ["Gammer Gurton's Needle"] is a capital example of farce, just as Ralph Roister Doister is of a rather rudimentary kind of regular comedy.
Saintsbury, Hist. Elizabethan Literature, iii.

The revelation of a rudimentary and imperfect science would be unworthy of God, and would require continual correction as knowledge advanced.
Dawson, Nature and the Bible, p. 21.

3. Specifically, in *biol.*: (a) Pertaining to or of the nature of a rudiment; rudimental; beginning to be formed; elementary; embryonic. (b) Vestigial; abortive; aborted or arrested in development; having no functional activity.

Organs, however little developed, if of use, should not be considered as rudimentary; they may be called nascent, and may hereafter be developed by natural selection to any further extent.
Darwin, Origin of Species, p. 406.

= Syn. 3. *Rudimentary*, *vestigial*, *abortive*. These three words, in their biological application, are commonly used interchangeably, and may mean exactly the same thing. But there is a clear and proper distinction in most cases, since that which is rudimentary in one organism may be fully developed in another organism, and that which is rudimentary in a given organism may or may not proceed to develop in that organism. So that which is developed in one organism but remains rudimentary in another is vestigial for the latter—that is, it affords a mere trace or hint of the former; and that which might have developed but did not develop in the same organism is abortive. Thus, all embryonic parts and organs are properly rudimentary; all functionless organs are vestigial which in another case have become functional; those which are normally functional but fail to become so in a given case are abortive. Rudimentary is the most general and comprehensive term for that which is rude, raw, crude, unformed, in an absolute sense; vestigial is a relative term, implying comparison with something else, of which that which is vestigial is a mere trace; abortive is likewise a relative term, but one implying arrest or failure of development in the thing itself, without reference to any other thing. Few if any organs can be described with equal accuracy by all three terms, though the distinctions are often ignored. Vestigial is a more technical term than either of the other two, implying a broad view of the thing described, derived from comparative anatomy and physiology, according to the theory of evolution. Abortive is specially applicable to pathological and teratological cases. A harelip or cleft palate is abortive, but neither vestigial nor rudimentary. The thymus of the adult is vestigial, but neither abortive nor rudimentary. The brain-bladders of the embryo are rudimentary, but neither vestigial nor abortive. Most of the functionless and apparently useless organs of adults of the higher animals are most properly to be designated as vestigial.

ruff² (ruf), *n.* [Formerly also *ruffe*; said to be < *ruff*¹, *n.*, and so named because the male has a ruff round its neck in the breeding season; but this is doubtful. The female is called a *reere*, a name supposed to be formed from *ruff* by some change left unexplained, but prob. from a different source.] The bird *Paroncella* or *Machetes pugnax* (the female of which is

Ruff (*Paroncella* or *Machetes pugnax*).

called a *reere*, a kind of sandpiper belonging to the family *Scelopaciæ*, having in breeding-plumage an enormous frill or ruff of feathers of peculiar texture on the neck, and noted for its pugnacity. It is widely distributed in the Old World, and occurs as a straggler in America. The length is about 12 inches. Besides the curious ruff, the bird has at the same season a pair of ear-tuffs and the face studded with fleshy tubercles. The general plumage is much variegated, and the feathers of the ruff sport in several colors and endlessly varied patterns. When these feathers are erected in fighting, they form a sort of shield or buckler. Also called *combatant* and *fighting sandpiper*.

It has often been said that no one ever saw two *Ruffs* alike. This is perhaps an over-statement; but . . . fifty examples or more may be compared without finding a very close resemblance between any two of them.

This grouse, either in its typical form or in some of its varieties, inhabits nearly all the woodland of North America. It ranks high as a game-bird; the flesh of the breast is white when cooked, like the bobwhite's. The head has a full soft crest; each ruff is composed of from fifteen to thirty broad soft feathers, glossy-black in the adult male, overlying a rudimentary tympanum. The wings are short and rounded; the tail is long, fan-shaped, normally of eighteen broad soft feathers; the tarsi are partly feathered, partly scaly. The plumage is intimately varied with brown, gray, and other shades; it is nearly alike in both sexes. This grouse is 17 inches long, and 23 in extent, the wings and tail from 7 to 8 inches each. It lays creamy or buff eggs, usually immaculate, sometimes speckled, 14 inches long by 1½ broad, of pyriform shape. See *Easter*.—**Golden rule.** See *golden*.—**Guldin's rule**, one of two rules, one giving the volume and the other the surface of any ring formed by the revolution of any plane closed curve about an axis lying in its plane. The rules are named after the Swiss mathematician Paul Guldin (1577-1643), but he obtained them from the collections of Pappus, a geometer of the fourth century.—**Home rule.** See *home*.—**Home-Rule Bill.** See *bill*.—**Inverse rule of three.** See *inverse*.—**Joint rule**, a rule adopted by both houses of Congress or a legislature for the conduct of transactions between them.—**Labor-saving rule**, in printing, brass rules cut by system to graduated lengths, so that they may be easily combined.—**Minding's rule**, a rule for the determination of the degree of an equation resulting from elimination, given by the Russian mathematician E. F. A. Minding in 1841.—**Napier's rule**, one of two mnemonic rules given by Napier, the inventor of logarithms, for the solution of right-angled spherical triangles. The two legs and the complements of the hypotenuse and of the angles are called the *parts*. An angle and one of the sides going to form it are said to be *adjacent*; so, also, are the two legs. A part adjacent to both or neither of two parts is called, relatively to them, the *middle part*; and if the other two are not adjacent to it, they are called *opposite*. Then, the two rules are that the sine of the middle part is equal to the product of the tangents of the adjacent parts and to the product of the cosines of the opposite parts. These are equivalent to six equations of different forms.—**Newton's rule**, a certain rule for determining a superior limit to the number of positive roots of an algebraic equation, and another for the negative roots. Let the equation be

$$ax^n + na_1x^{n-1} + \frac{n(n-1)}{1.2}a_2x^{n-2} + \text{etc.} = 0.$$

Form a series of quantities A, A_1, \dots, A_n , by the formula $A_r = a^2r - ar_{-1} + a_{r+1}$. Write down the two rows

$$\begin{array}{ccccccc} a_0 & a_1 & a_2 & \dots & a_n \\ A_0 & A_1 & A_2 & \dots & A_n \end{array}$$

If two successive numbers in the upper row have like signs while the numbers under them also have like signs, this is called a *double permanence*. But if two successive numbers in the upper row have different signs while the numbers under them have like signs, this is called a *variation-permanence*. The rule is that the number of negative roots cannot be greater than the number of double permanences, nor the number of positive roots greater than the number of variation-permanences.—**One-hour rule**, a standing rule of the United States House of Representatives, first adopted in 1847, in accordance with which no member, except one who reports a measure from a committee, may, without unanimous consent or permission given by vote, speak for more than one hour in debate on any subject.—**Parallel rule**, (a) A rule for drawing parallel lines. The old form of parallel rule consisted of two rulers connected by two bars turning upon pivots at the vertices of a parallelogram. For accurate work, a triangle and a straight-edge are used. (b) See *def. 8*.—**Rule day**, in legal proceedings, motion day; the regularly appointed day on which to make orders to show cause returnable.—**Rule of cosset**. See *cosset*.—**Rule of faith** (*regula fidei*), the sum of Christian doctrine as accepted by the orthodox church in opposition to heretical sects; the creed; a phrase used from the second century onward.—**Rule of false** (*regula falsae*), or **rule of double position**. See *position*.—**Rule of intersection**, **rule of six quantities**, the proposition that, if a spherical triangle be cut by a transversal great circle, the product of the chords of the doubles of three segments which do not enclose another is equal to the product of the chords of the doubles of the other three segments. This rule was discovered by Menelaus, about A. D. 100.—**Rule of mixtures**. Same as *alligation*.—**Rule of Nicomachus** (named from Nicomachus, a Greek arithmetician who flourished about A. D. 100, and who is said to have been the author of this rule), a rule for finding the square of a small number, as follows: subtract the number from 10 and to the square of the difference add 10 times the number diminished by the difference. Thus, to find the square of 9, subtract 9 from 10, which gives 1 as the difference, the square of which is 1, and adding to this 10 times the excess of the original number, 9, over the difference, 1, which excess is 8, we have 81 as the answer.—**Rule of philosophizing**, a rule for constructing theories. Newton propounded certain rules of this kind.—**Rule of signs**, the rule that any arrangement is positive or negative according as it contains an even or odd number of displacements.—**Rule of speech** (*regula sermonis*), the rule of false, so called because in the use of it we "say" a quantity has a value which is false.—**Rule of supposition**, the rule of false. See *position*.—**Rule of the double sign**, the principle that zero may be regarded either as positive or negative at pleasure, which has important applications under Budan's theorem.—**Rule of the octave**. See *octave*.—**Rule of the road**. See *road*.—**Rule of three**, the method of finding the fourth term of a proportion when three are given. The numbers being so arranged that the first is to the second as the third is to the fourth, which last is the term required to be found, then this is found by multiplying the second and third terms together, and dividing the product by the first.—**Rule of thumb**, a rule suggested by a practical rather than a scientific knowledge; in allusion to a use of the thumb in marking off measurements roughly.

We'll settle men and things by *rule of thumb*,
And break the lingering night with ancient rum.
Sydney Smith, To Francis Jeffrey, Sept. 3, 1809.

Rule of trial and error, the rule of false. See *position*.—**Rules of a prison**, certain limits outside the walls of a prison, within which prisoners in custody were sometimes allowed to live, on giving security not to escape. The phrase is sometimes extended to mean the space so enclosed, and also the freedom thus accorded to the prisoner.

To aid these, the prisoners took it in turns to perambulate the *rules*, and solicit help in money or kind.
J. Ashton, Social Life in Reign of Queen Anne, II. 247.

Both at the King's Bench and the Fleet debtors were allowed to purchase what were called the *Rules*, which en-

abled them to live within a certain area outside the prison, and practically left them free.

Rules of course, rules which are drawn up by the proper officers on the authority of the mere signature of counsel; or, in some instances, as upon a judge's fiat, or allowance by the master, etc. without any signature by counsel. Rules which are not of course are grantable on the motion either of the party actually interested or of his counsel.—**Rules of practice**, general rules prescribed by a court or other authority for the regulation of legal or other official procedure. See *def. 2*, above.—**Single rule**. See *def. 8*.—**Sliding rule**, a rule having one or more scales which slide over others for the purpose of facilitating calculations.—**Stationers' rule**, a rule of considerable length, made of hard wood about half an inch in thickness, usually marked with inches, and having its edges sheathed with brass strips. It is used for measuring, and as a straight-edge to guide a knife in cutting thick paper, as drawing-paper, pasteboard, etc.—**The rule in Shelley's case**, a much-quoted doctrine of the common law, to the effect that wherever there is a limitation to a man which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions) either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate of the ancestor, and not as a gift to the heir.—**To buy in under the rule**. See *buy*.—**Twenty-first rule**, in U. S. hist., a rule adopted by the House of Representatives in 1840, and dropped in 1844, prescribing that no abolition petitions should be received by the House.—**Waved rule**. See *def. 8*.—**Syn. 2. It is characterized by its six stamens and its six- or rarely four-parted perianth, with the outer segments unchanged in fruit, but the three inner ones erect and very much enlarged, often bearing a conspicuous grain or tubercle resulting from a thickening of the midrib. The included nut is sharply three-angled, but without wings. About 150 species have been enumerated, but the real number is much less. They are widely scattered throughout temperate regions, with a few native to the tropics and southern hemisphere. Many are common weeds of cultivated grounds, and some are almost cosmopolitan. They are usually perennial deep-rooting herbs, rarely tall shrubs. They bear united stipules (ocrea), which are often transparent, at first sheathing, soon torn and vanishing. The flowers are in small bracted clusters at the nodes, often forming terminal racemes or panicles. In the section *Lapathum*, the dock, the leaves are commonly large, undivided, and cordate or rounded at the base; in *Acetosa*, known as *sorrel*, they are small, commonly hastate, and permeated by an acid juice. Ruminantia (rō-mi-nan'shi-ā), *n. pl.* [NL., nent. pl. of *L. ruminant* (-t)-s, chewing the cud: see *ruminant*.] A series or section of artiodactyl ungulate mammals; the ruminants or ruminating animals, or hoofed quadrupeds that chew the cud. All are even-toed and cloven-footed, and have a complex stomach of several compartments, in the largest one of which food is received without being chewed, to be afterward regurgitated or thrown up into the mouth.

there chewed at the animal's leisure, and then swallowed again. In nearly all living ruminants the stomach has four compartments, or is quadripartite; these are the *rumen*, *paunch*, or *plain tripe*; the *reticulum*, or *honeycomb tripe*; the *omasum*, *psalterium*, or *manypplies*; and the *abomasum* or *rennet-bag*, succeeding one another in the order here given. The two former belong to the cardiac division of the stomach, the two latter to the pyloric. The families of living ruminants whose stomachs are thus perfectly quadripartite are—(1) the *Giraffidæ*, or camelopards; (2) the *Sainiæ* (if regarded as distinct from the *Bovidæ*); (3) the *Bovidæ*, or cattle, including also sheep and goats and all kinds of antelopes excepting (4) the *Antilocapridæ*; and (5) the *Cervidæ*, or deer family. In the *Camelidæ*, or camels and llamas, the stomach is imperfectly four-parted. In the *Tragidæ* it is tripartite, no psalterium being developed. Several extinct families are believed on other grounds (their stomachs being unknown) to have belonged to the *Ruminantia*. The ruminants are collectively contrasted with those ungulates which, though artiodactyl, do not ruminate, and are known as *Onnicoræ*, as the swine and hippopotamus. The average size of ruminants among mammals is large, a sheep being one of the smaller species; they are perfectly herbivorous, and have in addition to the pec-

The food of ruminants is entirely herbaceous, and consists chiefly of grass. This is rapidly cropped by grazing, and hastily swallowed, mixed with saliva. When its appetite is satisfied, the ruminant stands still, or often lies down, generally on its side. Then occurs a spasmodic action of the abdominal muscles and of the diaphragm, like a hiccup, which forces a bolus of grass, sodden in the fluids of the paunch, up the gullet and into the mouth, to be masticated or chewed at leisure. During this second chewing the cud is mixed with more saliva, thoroughly ground to pulp, and in this semi-fluid state it is finally swallowed. The cropped grass, when first swallowed, passes indifferently into either the rumen or the reticulum (which are in fact only two compartments of the cardiac division of the stomach, the gullet entering the stomach just at their junction), and in the ordinary peristaltic action of the stomach the fodder passes back and forth from one to the other. But there is an arrangement of muscular folds by means of which a canal may be formed that leads directly from the gullet past the rumen and reticulum into the psalterium, and by this channel the food, when returned after the rumination, may be conducted directly to the third stomach. Water drunk passes easily into any of the four stomachs according to circumstances. Neither the paunch nor the honeycomb is ever completely emptied of food; they have been found partly filled with sodden fodder in animals which have starved to death. It does not appear, as has been supposed, that the reticulum is specially concerned in modeling the boluses which are to be regurgitated. The regurgitation is effected by the reversed peristaltic action of the gullet. During the spasmodic action by which the sodden mass is driven against the opening of the gullet, and some of it forced into the gullet to be thrown up, it is prevented from passing into the psalterium partly by the narrowness of the opening between the reticulum and the psalterium, and partly by the resistance offered to the coarse mass by the close-pressed psalterial leaves or layers, which act like a fine grating. But when the mass is swallowed again in its now pulpy and semi-fluid state, and is directed to the psalterium by the conformation of the parts, it readily soaks in through the psalterial layers, and thus reaches the abomasum or fourth stomach, where it is finally chymified by the action of the gastric juice, to which it is not before subjected. Rumination in man, when it is pathological, is also called *mergion*.

but not subject to any Greek patriarchate. Christianity
existed to some extent in earlier times in Russia, but was
first permanently introduced, from Constantinople, by the
great prince St. Vladimir, in 988. The seat of the metro-
politan was at first at Kiev; it was transferred to Vladi-
mir in 1299, and in 1388 to Moscow. In 1589 the metro-
politan of Moscow was made patriarch, with the consent
of the rest of the Eastern Church. In 1721, with the ap-
proval of the Greek patriarchs, the Holy Governing Synod
succeeded to the power of the patriarch. The members
of this synod are appointed by the emperor. Among them
are a metropolitan as president, several other metropol-
itans and prelates, secular priests, and the procurator-gen-
eral, a layman, representing the civil power. The bishops
are all virtually equal in power, though ranking as metro-
politan, archbishops, and ordinary bishops. The Russian

The cereal plant *Secale cereale*, or its seeds. Its nativity appears to have been in the region between the Black Sea and the Caspian. Its culture has been chiefly in the north, and, though ancient, is not of the highest antiquity. It bears more cold than any other grain, thrives on light and otherwise barren soils, and can be grown continuously on the same spot. It is most extensively produced in central and northern Europe, where it forms the almost exclusive breadstuff of large populations, furnishing the black bread of Germany and Russia, and the rye-cakes which in Sweden are baked twice in a year and preserved by drying. A sweet bread is also made from rye. The roasted grains have long been used as a substitute for coffee. Rye enters in Russia into the national drink, kvass, in Holland into gin, and in the United States it is the source of much whisky. The young plant affords a useful green fodder; the straw is valued for thatching, for filling mattresses, for the packing of horse-collars, etc. Rye is often planted with grass-seed in the United States as a protection during the first season, and similarly with pine-seeds in the Alpine region. It has spring and fall varieties, one of the latter being known as *Wallachian*; in general it has less varieties than other much-cultivated plants. Phenician.

Early
Greek and Latin.

The Phoenician system had more than one sibilant sign, and the Greek choice wavered at first between two of them, until it settled upon this one. Of all the signs here given the value was the same—namely, our normal *s*-sound, as in *so, us*. This is a surd or breathed utterance, a fricative or continuant consonant, of a peculiar character, to which we give the name of *sibilant* or *hissing*. Its sonant or voiced counterpart (related to it as *d* to *t*, as *v* to *f*, and so on) is *z*, as in *zeal, dizzy* (the buzzing sound). They are produced between the tongue, at or near its tip, and a point on the roof of the mouth either close behind the front teeth or at a further remove from them. Probably no other of our alphabetic sounds are producible through so wide a range of (slightly) varying positions, or actually produced, in different districts and individuals, in so different a manner. None, also, are more freely combinable with other consonant-sounds into intricate groups, as in *strands, twelfths, splints, sixths*. In virtue of their mode of production, they are akin with *t* and *d*, and like them, are often called dental, or lingual, or tongue-tip sounds. The proper or hissing *s* is one of the most common elements of English utterance, forming more than 4½ per cent. of it. But its sign has also other values. As *s* is one of our most used endings—for example, of plural number, of possessive case, of third person singular present—it comes extremely often at the end of a word, and there, after any sonant sound, it is pronounced as *z*: for example, *loves, love's, he loves; flies, fly's, he flies*; and it has the same sound often in the interior of words, especially between sonants: for example, *use, nose, dismal*. The *s*-sound, on the other hand, is represented to a considerable extent by *c* before *e, i, y* (see *C*); and by double *s* or *ss*, which is frequent in the middle and at the end of words, and has the hissing sound, save in a few exceptional cases, like *dis-solve, possess* (between the *a* and *e*). Another sound often represented by *s* is the *sh*-sound (see below)—namely, in very numerous cases where the *s* is followed by a consonantal *y*-sound, whether written with *i*, as in *passion*, or implied in “long *u*,” as in *sure, fissure*: since the combination *sy* in English pronunciation has a strong tendency to fuse into *sh*, and in ordinary free utterance often does so, even in cases where theory and extra-careful usage require the separation of the two sounds. This fused sound is represented by the important digraph *sh* (also by *ch* in a few French words, as *machine*). It is a second sibilant, a more palatal one—as simple an utterance as the *s*-sibilant, but very much less frequent (less than 1 per cent., or one fifth of *s*; but about 1½ per cent. if its presence in the *ch*-sound is included). It is made with nearly the same part of the tongue as *s*, and against the roof of the mouth, but generally a little further back, and especially (it would seem) with an opener cavity immediately behind the point of closest approximation of the organs. Its compound sign (Middle English and German *sch*) marks it as coming historically from the fusion of an *s* with a following guttural spirant. It has a rare sonant counterpart in the *zh*-sound of *azure, pleasure*, and the like (as to which, see *Z*). The *sh*- and *zh*-sounds also constitute the concluding element in the compound *ch*- and *j*- or soft *y*-sounds (see *ch* and *G* and *J*) combined with a somewhat modified *t* and *d* respectively (made by a contact at the *sh*-point) as first element.

S.* (Bachelor of Science). (d) Of *South* or *Southern*. (e) Of *Sunday* and *Saturday*. (f) [*l. c.*] Of Latin *solidum*, equivalent to English *shilling*: as, £ *s. d.*, pounds, shillings, pence. (g) In *anat.* and *zool.*, of *sacral*: used in vertebral formulæ: as, *S. 5*, five sacral vertebrae. (h) [*l. c.*] Of *second* (sixtieth part of a minute), *substantive* (a noun), *snow* (in a ship's log-book), of Latin *semi*, half (used in medical prescriptions after a quantity which is to be divided into two), and of *spherical* (of

a lens). (i) [*l. c.*] In *her.*, of *sable*. (j) In *metr.*, of *stratus*. (k) In *musical notation* (1), of *senza*; (2) in the form *S*., of *segno* (see *D. S.* and *segno*).—5. An operative symbol in quaternions, signifying the operation of taking the scalar part of a quaternion. It is also used in algebra for certain varieties of summation. The lower-case *s* usually denotes space, or the length of the arc of a curve. An *s* below the line, in enumerative geometry, refers to a plane pencil of rays. Σ (Greek *S*) signifies the sum of successive values of a function; the variable which is to take successive integral values in the terms to be added may be written below the line after the Σ , and the lower and upper limit of the summation may be written below and above the Σ . Thus,

$$ax = \sum_{n=0}^{\infty} \frac{1}{n!} \cdot (\log. x)^n.$$

In the calculus of finite differences Σ is used like a sign of indefinite integration, the lower limit being replaced by an arbitrary constant, while the upper is supposed to be 1 less than the value of the variable. Thus, $\Sigma Fx = F(x-1) + F(x-2) + \text{etc.}$, down to a constant value of the variable, and then an arbitrary constant is to be added to the series. σ is used in the integral calculus to denote the area of a surface. A modified long *s*, *f*, is the sign of integration.—Light green *S*. Same as acid-green.—Magenta *S*, rubine *S*. Same as acid-magenta.

Sabal (sā'bal), n. [*Nl.* (Adanson, 1763); said to be from a *S. Amer.* or *Mex.* name.] A genus of fan-palms of the tribe *Corypheæ*, including several palmettos. It is distinguished from the genera next akin, *Washingtonia* and *Corypha*, by its dorsal embryo, and is further characterized by bisexual flowers with a cup-shaped calyx and a deep-lobed imbricate corolla persistent unchanged after blossoming, by its six united stamens forming at their dilated bases a ring attached to the corolla-tube, and by its three-lobed and three-celled ovary, tapering into a robust columnar style which is basilar in fruit. The fruit is usually globose and one-celled, with a loose fleshy pericarp, and a single shining dark-brown roundish and depressed seed, with hard corns albumen which is deeply hollowed in at the base. The 7 species are natives of tropical America, from Venezuela and Trinidad northward into Florida and South Carolina and the Bermuda Islands. They are thornless palms, some species low and almost stemless, others with a tall robust trunk ringed at the base and covered above with the remains of sheaths. The leaves are terminal, roundish, and deep-cleft; the flowers are small and smooth, white or greenish, and the fruit is small and black, borne on a large and elongated spadix which is at first erect, and inclosed in a long tubular spathe, from which hang many long and slender branches and bractelets. II. n. One who maintains the observance of the Sabbath (in the original sense) as obligatory on Christians. Hence—(a) One who observes the seventh day of the week as the Sabbath, as the Jews do, instead of the first (Sunday), as do Christians generally. A denomination of Baptists are called *Sabbatarians*, or *Seventh-day Baptists*, because they maintain that the Jewish Sabbath has not been abrogated. The Seventh-day Adventists hold the same views.

And because some few sabbatarians among ourselves do keep the old sabbath only, and call still for Scripture proof for the institution of the Lord's day, let me briefly tell them that which is enough to evince their error.

Baxter, Life of Faith, ii. 7.

(b) One who observes the Sabbath (whether Saturday or Sunday) according to the real or supposed Jewish rules for its observance; hence, one who observes it with more than the usual strictness. In the Puritan controversies of the sixteenth century the church party maintained that the obligation to observe one day in seven as a day of rest and devotion rested not upon the fourth commandment, but upon church usage and the beneficent results arising therefrom; the Puritans maintained that the obligation was based upon the Jewish law, and that the nature of the obligation was to be deduced from the Jewish regulations. They interdicted every sort of worldly occupation and every form of pastime and recreation, and were termed *Sabbatarians* by their opponents; hence the later use of the term as one of reproach.

We have myriads of examples in this kind amongst those rigid *Sabbatarians*. *Burton, Anat. of Mel., p. 680.*

We left Lillehammer on a heavenly Sabbath morning. . . . Rigid *Sabbatarians* may be shocked at our travelling on that day; but there were few hearts in all the churches of Christendom whose hymns of praise were more sincere and devout than ours. *B. Taylor, Northern Travel, p. 254.*

There were as many people as are usually collected at a muster, or on similar occasions, lounging about, without any apparent enjoyment; but the observation of this

Purchas, Pilgrimage, p. 122.

Let us not therefore keep the sabbath (or sabbatize) Jewishly, as delighting in idleness (or rest from labour).

Baxter, Divine Appointment of the Lord's Day, vii.

It is characterized by flowers with all the stamens perfect and the sepals and petals nearly equal, by the number of parts in each of these sets (four or five), and by their peculiar arrangement, which is opposite throughout, contrary to the usual law of alternation. There are about 12 species, natives of tropical and temperate parts of Asia. They are climbing or twiggy shrubs, with roundish branchlets, around the base of which bud-scales remain persistent. It includes about 40 species, belonging to 4 genera, of which *Sabia* is the type, natives of tropical and subtropical regions, chiefly northern. They are smooth or hairy shrubs or trees, bearing alternate simple or pinnate feather-veined leaves without stipules, and usually small flowers in panicles.

The general name of any crystalline sugar having the formula $C_{12}H_{22}O_{11}$ which suffers hydrolysis on heating with water or dilute mineral acid, each molecule yielding two molecules of a glucose. The saccharoses are glucose anhydrids. The best-known are saccharose or cane-sugar, milk-sugar, and maltose.

2. Specifically, the ordinary pure sugar of commerce, obtained from the sugar-cane or sorghum, from the beet-root, and from the sap of a species of maple. Chemically, pure saccharose is a solid crystalline body, odorless, having a very sweet taste, very soluble in water, less soluble in alcohol, and insoluble in absolute alcohol. Its aqueous solution is strongly dextrorotatory. It melts at $160^\circ C$, and decomposes at a higher temperature. Heated sufficiently with water or dilute mineral acid, it breaks up into equal parts of dextrose and levulose. Saccharose does not directly undergo either alcoholic or lactic fermentation; but in the presence of certain ferments it is resolved into dextrose and levulose, which are readily fermentable. It unites directly with many metallic oxides and hydrates to form compounds called *saccharates* or *saccharates*. Saccharose is extensively used both as a food and as an antiseptic. It is also used to some extent in medicine. Also called *cane-sugar*.

2. A unit of dry measure. English statutes previous to American independence fixed the sack of flour and meal at 5 bushels or 280 pounds, that of salt at 5 bushels, that of coal at 3 bushels (the sacks to measure 50 by 26 inches), and that of wool at 3 hundred-weight or 364 pounds. Since 1870 the British sack has been 4 imperial bushels. Locally, sacks of 2, 3, 3½, and 4 bushels were used as measures in England. The sack has been a widely diffused unit, varying in different countries, from 2 to 4 Winchester bushels. Thus, it was equal to 2 such bushels at Florence, Leghorn, Leyden, Middelburg, Tournon, etc.; to 2½ at Zealand and Beaumont; to 2½ at Haarlem, Goes, Geneva, Bayonne; to 2½ at Amsterdam; to 2½ at Agen, Utrecht, etc.; to 2½ at Dort and Montauban; to 2½ at Granada and Emden; to 2½ at Ghent; to 3 at Strasbourg, Rotterdam, The Hague, and in Flanders (the common sack); to 3½ at Brussels; and to 3½ at Basel. The sack of Hamburg was nearly 6 bushels, that of Toulon still greater, while the sack of Paris, used for plaster, was under a bushel.

sack² (sak), *n.* [*< F. sac* = *Sp. sacco* = *It. sacco*, *sacco*, *sacque* = *It. sacco*, sack, plunder, pillage; ult. < *L. saccus*, a bag, sack (see *sack*¹), but the precise connection is uncertain. In one view, it is through a particular use of the verb represented by *E. sack*¹, 'put into a bag,' and hence, it may be supposed, 'conceal and take away' (cf. *bag*¹, and *packet*, in similar uses); but no such use of the *OF.* and *ML.* verb appears. The *Rom.* verbs meaning 'sack' being secondary forms, depending on the noun (see *sack*¹, *r. sac-cage*, *v.*); besides, the town or people 'sacked' is not 'put into a bag.' The origin is partly in the *OF.* "a *sac*, a *sac*, the word whereby a commander authorizeth his souldiers to sack a place or people" (Cotgrave). = *It. a sacco*, "asacco, asaccmanno, to the spoil, to the sacke, ransack" (Florio)—the exhortation a *sac*, *It. a sacco*, 'to plunder,' prob. meaning orig. 'to bag!' i. e. fill your pouches (*OF. sac* = *It. sacco*, a bag, pouch, wallet, sack: see *sack*¹, *n.*); and partly in the *Sp. sacomano*, a plunderer, also sack, plunder, pillage, = *It. saccomano*, a plunderer, freebooter, scout, soldier's servant, also plunder; < *ML. saccomannus*, a plunderer, *saccomannum*, plunder, < *MHG. sackman*, a soldier's servant, camp-servant (*sackman machen*, plunder), lit. 'sack-man,' one who carries a sack, < *sack*, = *E. sack*, + *man* = *E. man*.] 1. The plundering of a city or town after storming and capture; plunder; pillage: as, the *sack* of Magdeburg.

The people of God were moved, . . . having beheld the sack and combustion of his sanctuary in most lamentable manner flaming before their eyes.

The *middle sacral veins* are two veins which follow the course of the middle sacral artery, and terminate in the left common iliac vein or at the junction of the iliacs.—**Sacral vertebrae**, those vertebrae which unite to form a sacrum, usually five in number in man. They range in number from the fewest possible (two) to more than twenty. In animals with the higher numbers, especially birds, many of these ankylosed bones are really borrowed from other parts of the spinal column; they are collectively known as *false sacral vertebrae*, and distinctively as *lumbosacral and urosacral*. (See these words, and *sacrum*2.) In a few mammals (cetaceans and sirenians, without hind limbs), many reptiles (serpents, etc.), and most fishes, no sacral vertebrae are recognizable as such. 2. In *theol.*, an outward and visible sign of inward and spiritual grace; more particularly, a solemn religious ceremony enjoined by Christ, or by the church, for the spiritual benefit of the church or of individual Christians, by which their special relation to him is created or freshly recognized, or their obligations to him are renewed and ratified. In the Roman Catholic Church and the Greek Church there are seven sacraments—namely, baptism, confirmation, the eucharist, penance, holy orders, matrimony, and (in the Roman Catholic Church) extreme unction or (in the Greek Church) unction of the sick. Protestants in general acknowledge but two sacraments, baptism and the Lord's Supper. The difference of view as to the value or significance of sacraments is more important than the difference as to their true number. In general it may be said that there are three opinions respecting them: (a) that the sacrament is a means of grace acting directly upon the heart and life, "a sure and certain means to bring peace to our souls" (*Bishop Hay, Sincere Christian*); (b) that the sacrament, though not in itself the means of grace, is nevertheless a solemn ratification of a covenant between God and the individual soul; (c) that the sacrament is simply a visible representation of something spiritual and invisible, in which case the symbol is without spiritual value or significance. The first view is held by the Roman Catholics, the Greeks, and some in the Anglican communion; the second by most Protestants; the third by the orthodox churches, and, in modern times, by some of the orthodox churches, especially of the Congregational denominations. The Quakers, or Friends, reject altogether the doctrine of the sacraments.

dog, or from their assumed or ascribed charac-
ter, the word *tsaduqim* being pl. of *tsaduq*, lit.
 'the just one,' *< tsaduq*, be just.] An adherent
 of a skeptical school of Judaism in the time of
 Christ, which denied the immortality of the
 soul, the existence of angels, and the authority
 of the historical and poetical books of the Old
 Testament and of the oral tradition on which
 Pharisaic doctrine was largely founded. It is
 not easy to define exactly the doctrine of the Sadducees,
 because it was a negative rather than a positive philoso-
 phy, and a speculative rather than a practical system; and
 for our knowledge of it we are almost wholly dependent
 on the representations of its opponents. It was the doc-
 trine of the rich, the worldly, and the complacent.

The doctrine of the *Sadducees* is this, that souls die
 with the bodies; nor do they regard the observation of
 any thing besides what the law enjoins them.

Josephus, *Antiquities* (trans.), XVIII. i. § 4.

In foremost rank, here goe the *Sadduces*,

cisme; as *Sadducee* + *-ism*.] 1. The doctrinal
 system of the Sadducees.

Sadduceism was rather a speculative than a practical
 system, starting from simple and well-defined principles,
 but wide-reaching in its possible consequences. Perhaps
 it may best be described as a general reaction against the
 extremes of Pharisaism, springing from moderate and ra-
 tionalistic tendencies.
Eldersheim, *Life and Times of Jesus*, I. 313.

2. Skepticism.

Sadduceism has so completely become the quasi-scient-
 ific term of theology for the indifference or unbelief of
 the day, and especially for the sceptical tone of modern
 literature, that one might have expected the undoubted
 orthodoxy of the Pharisees would have saved them from
 reproach.
H. N. Oxenham, *Short Studies*, p. 3.

Sadducism (sadd'-n-sizm), *n.* [*< Sadduc(ee)* +
-ism.] Same as *Sadduceism*. [Rare.]

Safes as now made may be divided into two classes: stationary safes of stone, brick, or metal, built as part of the structure of a warehouse, store, or other building, and commonly called *caulds*; and portable safes of steel and iron. The term *safe* is usually restricted to portable safes, whatever their size or material. These safes are usually of two or more metals, as cast-iron, chilled iron, and steel, combined in various ways to resist drilling, and are made with hollow walls filled with some non-conductor of heat. A great variety of devices have been added to safes to insure greater efficiency, such as rabbeted airtight doors, time-locks, and burglar-alarms. The body (see the section) is made up of alternate plates of steel (a) and iron (b), the steel plates being interposed to obstruct drilling. The large bolts d are conical in form, and the smaller countersunk screws, as well as the lock-spindle, are all made of twisted iron and steel laminated like the bolts. In the most recent construction the lock-spindle, instead of being a single piece, is made sectional, the sections being socketed each into another to present still further obstruction to drilling. Compound hinges are also provided,

a, outer casing of iron; b, door; c, filling of mixed alum and plaster of Paris.

When the safe here figured is exposed to heat the alum gives off its water of crystallization, which becomes steam at ordinary atmospheric pressure, thus inclosing the contents in an envelop of steam at 212° F., which is maintained until the water is all expelled.

safety-lamp (săf'ē-ti-lamp), *n.* In mining, a form of lamp intended for use in coal-mining, the object of the arrangement being to prevent the inflammable gas by which the miner is often surrounded from being set on fire, as would be

the case were the flame not protected from contact with the gas. The basis of the safety-lamp, an invention of Sir Humphry Davy in 1816, is the fact, discovered by him, that flame cannot be communicated through a fine wire gauze. About 784 apertures to the square inch is the number generally adopted, the lamp being surrounded by a cylinder, about an inch and a half in diameter, made of a metallic gauze of this description. Various improvements have been made by Clanny, George Stephenson, Mueseler, and others, in the safety-lamp as originally devised by Davy. Stephenson's lamp is called by the miners a *geordie*. The Mueseler lamp is the one chiefly used in Belgium, and has been introduced in England. The essential feature of the Davy lamp remains in all these improvements, the object of which is to get more light, to secure a more complete combustion of the oil, and to prevent the miners from using the lamp without the gauze.

safety-link (săf'ē-ti-lingk), *n.* A connection between a car-body and its trucks, designed to limit the swing of the latter.

The paper may be colored with a pigment which must be defaced if the surface is tampered with, treated with a chemical which causes writing upon it to become fixed in the fiber, made up of several layers having special characteristics, peculiarly water-marked, incorporated in the pulp with a fiber of silk, etc. The last method is used for the paper on which United States notes are printed.

safety-pin (săf'ē-ti-pin), *n.* A pin bent back on itself, the bend forming a spring, and having the point fitting into a kind of sheath, so that it may not be readily withdrawn or prick the wearer or others while in use.

safety-plug (săf'ē-ti-plug), *n.* 1. In steam-boilers, a bolt having its center filled with a fusible metal, screwed into the top of the fire-box, so that when the water becomes too low the increased temperature melts out the metal, and thus admits steam into the fire-box or furnace to put the fire out. Also called *fusible plug*.—2. A screw-plug of fusible metal used for the same purpose in steam-heating boilers carrying pressures of from 5 to 10 pounds.—3. A form of spring-valve screwed into a barrel containing fermenting liquids to allow the gas to escape if the pressure becomes too great.

safety-stop (săf'ē-ti-stop), *n.* 1. On an elevator or other hoisting-apparatus, an automatic device designed to prevent the machine from falling in case the rope or chain breaks. In the accompanying cut, *a* is the hoisting-rope; *b*, bar or link by which the attachment of the rope to the elevator-frame *g* is made through the intervening bell-cranks *c*, carrying the sliding catches or pawls *e*; *d*, spring which, when the rope breaks, forces the inner ends of the bell-cranks downward, and the catches *e* outward into engagement with the ratches *f*, thus immediately stopping the descent of the elevator.

2. In *firearms*, a device to lock the hammer in order to prevent an accidental discharge.—3. On a pulley or sheave, a stop to prevent running backward.—4. In a spinning-machine, loom, etc., a device for arresting the motion in

It is passed over the seat of a gig-saddle, the terrets of which are inserted through holes in the strap. The ends of the strap are buckled to the shaft-tugs.—**Brake safety-strap**, an iron or steel strap so bent as to embrace the brake-beam of a car-truck, to the end-pieces or transoms of which the ends of the safety-strap are secured. Its function is to prevent the beam from falling on the track if any of the hangers give way. It is sometimes made to serve as a brake-spring to throw off the brake.

safety-valve (săf'ti-valv), *n.* A contrivance

Ordinary weighted safety-valves.

a and *b* show the weight applied with levers as in power-boilers, while in *c* and *d* the weights are directly applied to the valve-stem—a common method with low-pressure steam-boilers used for steam-heating.

for obviating or diminishing the risk of explosion in steam-boilers. The form and construction of safety-valves are exceedingly various, but the principle of all is the same—

that of opposing the pressure within the boiler by such a force as will yield before it reaches the point of danger, and permit the steam to escape. The most simple and obvious kind of safety-valve is that in which a weight is placed directly over a steam-tight plate fitted to an aperture in the boiler. When, however, the pressure is high, this form becomes inconvenient, and the lever safety-valve is adopted. — **Internal safety-valve**, in a steam-boiler, a valve which opens inward to admit air into the boiler when a partial vacuum has been formed by the condensation of the steam. — **Lock-up safety-valve**, a safety-valve having the weighted lever or spring shut in a locked chamber so that it cannot be interfered with except by the person holding the key. — **Spring safety-valve**, a form of safety-valve the pressure of which is controlled by a gaged or adjustable spring or set of springs.

Europe, Egypt, India, and China. It is sometimes planted in herb- and flower-gardens in the United States. Safflower as a medicine has little power, but is still in domestic use as a substitute for saffron. As a dyestuff (its chief application), it imparts bright but fugitive tints of red in various shades. It is extensively used at Lyons and in India and China in dyeing silks, but has been largely replaced by the aniline dyes. It is much employed in the preparation of rouge, and serves also to adulterate saffron. (See *carthamin*.) In India a lighting and culinary oil is largely expressed from its seeds. Also called *African*, *false* or *bastard*, and *dyers' saffron*.

A product consisting of the dried stigmas of the flowers of the autumnal crocus, *Crocus sativus*. The true saffron of commerce is now mostly *hay saffron*—that is, it consists of the loose stigmas uncaked. The product of over four thousand flowers is required to make an ounce. It has a sweetish aromatic odor, a warm pungent bitter taste, and a deep orange color. In medicine it was formerly deemed highly stimulant, antispasmodic, and even narcotic; it was esteemed by the ancients and by the Arabians; and on the continent of Europe it is still much used as an emmenagogue. Experiments, however, have shown that it possesses little activity. It is also used to color confectionery, and in Europe and India is largely employed as a condiment. Saffron yields to water and alcohol about three-fourths of its weight in an orange-red extract, which has been largely used in painting and dyeing, but in the latter use is mostly replaced by much cheaper substitutes.

2. The plant which produces saffron, a low bulbous herb. *Crocus sativus*, the autumnal crocus. The saffron resembles the ordinary spring crocus. It has handsome purple flowers, the perianth funnel-shaped with a long slender tube, the style with its three stigmas, which are over an inch long, hanging out on one side. It is thought to be a native of Greece and the Levant, its wild original being perhaps a form of *C. Cartwrightianus*. It is grown for its commercial produce in parts of southern Europe, especially in Spain, and in Asia Minor, Persia, Cashmere, and China.—**African saffron**. See *safflower* and *Luparia*.—**Aperitive saffron of Mars**. Same as precipitated carbonate of iron (which see, under *precipitate*).—**Bastard or false saffron**. Same as *safflower*.—**Dyers'**

Saguin (Callithrix personatus).

= **Syn.** *Saguin*, *sajou*, *sai*, *saimiri*, *sapajou*. These are all native names of South American monkeys, now become inextricably confounded by the different usages of authors, if indeed they had originally specific meanings. *Sai* is the

most general term, meaning monkey. *Sajou* and *sapajou* are the same, meaning a prehensile-tailed monkey of one of the genera *Cebus* and *Ateles*; but *sapajou* has become associated specially with *Ateles*, then meaning spider-monkey. *Saguin* was one of the smaller species of *Cebus*, but became confused with *saimiri*. *Saguin* and *saimiri* are now specially attached to the small non-prehensile-tailed squirrel-monkeys, respectively of the genera *Callithrix* and *Chrysothrix*, but are also loosely used for any of the marmosets.

Gray's classification, a family of hollow-horned ruminants, represented by the genus *Saiga*; the saiga-antelopes, having the nose peculiarly inflated and expanded, the conformation affecting not only the outward parts, but the bones of the nasal region. The nasal bones are short, arched upward, and entirely separated from the maxillaries and lacrymals: the frontal bone projects between the lacrymals and nasals, and the maxillaries and premaxillaries are both much reduced. The group would be better named *Saiginae*, as a subfamily of *Bovidae*.

sail¹ (sāl), *n.* [< ME. *saile*, *sayle*, *seil*, *seyl*, < AS. *segel*, *segl* = OS. *segel* = MD. *seyl*, D. *zeil* = MLG. *LG. segel*, *seil* = OHG. *sigel*, MHG. *G. segel* = Icel. *segl* = Sw. *segel* = Dan. *sejl* (Goth. not recorded), a sail. Root unknown; certainly not < L. *sagulum*, a mantle.] 1. A piece of cloth, or a texture or tissue of some kind, spread to the wind to cause, or assist in causing, a vessel to move through the water. Sails are usually made of several breadths of canvas, sewed together with a double seam at the borders, and edged all round with a cord or cords called the *bolt-rope* or *bolt-ropes*. A sail extended by a yard hung (slung) by the middle is called a *square sail*; a sail set upon a gail, boom, or stay is called a *fore-and-aft sail*. (See *fore-and-aft*.) The upper part of every sail is the head, the lower part the foot, the sides in general are called *leeches*; but the weather side or edge (that is, the side next the mast or stay to which it is attached) of any but a square sail is called the *luff*, and the other edge the *after leech*. The two lower corners of a square sail are in general *clues*; the weather clue of a fore-and-aft sail, or of a course while set, is the *tack*. Sails generally take their names, partly at least, from the mast, yard, or stay upon which they are stretched; thus, the main-course, maintopmast, and maintopgallantsail are respectively the sails on the mainmast, maintopmast, and maintopgallantmast. The principal sails in a full-rigged vessel are the courses or lower sails, the topmasts, and the topgallantsails. See *topmast*, *topmast-yard*, and *cut* under *ship*.

3. One who is eminent for consecration, holiness, and piety in life and character; specifically, one who is generally or officially recognized as an example of holiness of life, and to whose name it is customary to prefix *Saint* (abbreviated *St.* or *S.*) as a title. The persons so honored were, in the earlier centuries, the Virgin, the apostles and martyrs, and others commemorated in the diptychs or recognized by public opinion. In later times the process of canonization or beatification became a matter of strict regulation by papal or patriarchal authority in the Roman Catholic and Greek churches. Saints are classed in calendars by their rank, as apostles, bishops, archbishops, priests, deacons, kings, etc., and also as martyrs, confessors, and virgins. The title of *saint* is also given to angels, as *St. Michael*, *St. Gabriel*, *St. Raphael*. In the phrases given below many diseases will be found named from those saints whose intercession was especially sought for their cure. When *saint* is used before a person's name as a quasi-title (originally an adjective), it is commonly abbreviated *St.*; but such names, and surnames and local names derived from them, are properly alphabetized under the full form *saint*.

We have decided and defined the Blessed Francis de Sales, Bishop of Geneva, to be a *Saint*, and have inscribed him on the catalogue of the *Saints*.

Salary grab. See *grab*. = *Syn. Salary, Stipend, Wages, Pay, Hire, Allowance.* An allowance is gratuitous or discretionary, and may be of any sort: as, an *allowance* of a pitcher of wine daily to Chaucer; the rest are given from time to time in return for regular work of some kind, and are presumably in the form of money. Of these latter *pay* is the most generic; it is especially used of the soldier. *Wages* and *hire* are for the more menial, manual, or mechanical forms of work, and commonly imply employment for short periods, as a day or a week; *salary* and *stipend* are for the more mental forms, and imply greater permanence of employment and payment at longer intervals: the *wages* of a servant or a laborer; the *salary* of a postmaster or a teacher. *Hire* is Biblical and old-fashioned. *Stipend* is used chiefly as a technical term of the English and Scotch churches. See *wages*.

The most considerable offices in church and state were put up to *sale*. Prescott, *Ferd. and Isa.*, ii. 25.

2. In *law*, a contract for the transfer of property from one person to another, for a valuable consideration. Three things are requisite to its validity, namely the thing sold, which is the object of the contract, the price, and the consent of the contracting parties. (Kent.) The word *sale* is often used more specifically as indicating the consideration to be pecuniary, as distinguished from barter or exchange. It is also often used as indicating a present transfer, as distinguished from a contract to transfer at a future time, which is sometimes termed an *executory sale*. In respect to real property, *sale* usually means the executory contract or bargain, as distinguished from the deed of conveyance in fulfillment of the bargain.

3. Opportunity to sell; demand; market.

The countrymen will be more industrious in tillage, and rearing of all husbandry commodities, knowing that they shall have a ready *sale* for them at those towns. Spenser.

Species of *Eudophia* are assigned as sources of salep in India. The salep of the European market is prepared chiefly in Asia Minor, and in small quantities in Germany; that of the Indian market is from Persia and Tibet, or local. Salep contains 48 per cent. of mucilage

and 30 per cent. of starch; it is largely insoluble in water, but swells up when steeped. In the East it is highly esteemed as a nerve restorative and fattener; but it appears to have no other properties than those of a nutrient and demulcent. In Europe it is chiefly used in making a variously seasoned demulcent drink. It is a suitable food for convalescents, etc., like tapioca and sago. It is prepared for use by pulverizing and boiling. Saliū*, a tribe of Franks; see *Salian¹*.] Based on or contained in the code of the Salian Franks; specifically applied to one of the laws in that code which excluded women from inheriting certain lands, probably because certain military duties were connected with such inheritance. In the fourteenth century females were excluded from the throne of France by the application of this law to the succession to the crown, and it is in this sense that the phrase *Salic law* is commonly used.

A French antiquarian (Claude Seissel) had derived the name of the *Salic Law* from the Latin word *sal*, comme une loy pleine de sel, c'est à dire pleine de sapience, and this the Doctor thought a far more rational etymology than what some one proposed, either seriously or in sport, that the law was called *Salique* because the words *Si*

aliqui and *Si* aliqui were of such frequent occurrence in it.

Southey, The Doctor, xviii. (Davies.)

The famous clause in the *Salic Law* by which, it is commonly said, women are precluded from succession to the throne, and which alone has become known in course of time as the *Salic Law*, is the fifth paragraph of chapter 59 (with the rubric 'De Alodis'), in which the succession to private property is regulated.

It possesses tonic properties, and is sometimes used as a substitute for salicylic acid in the treatment of rheumatism.

Salicineæ (*sal-i-sin'ē-ē*), *n. pl.* [*NL.* (L. C. Richard, 1828), < *Salix* (*Salic*) + *-ineæ*.] A well-defined order of apetalous plants, little related to any other. It is characterized by divaricate inflorescence with both sorts of flowers in catkins, a perianth or disk either cup-shaped or reduced to gland-like scales, two or more stamens to each flower, and a one-celled ovary becoming in fruit a two- to four-valved capsule with numerous minute seeds which bear a long dense tuft of white hairs at one end. There are 178 (or, as some estimate them, 300) species, natives of temperate and cold regions, widely scattered throughout the world, rarer in the tropics, and very few in the southern hemisphere. They are trees or shrubs, bearing alternate entire or toothed leaves, free stipules, and catkins produced before or with the leaves, often clothed with long silky hairs. The order is composed of but two genera, *Salix* (the type) and *Populus*. Also *Salicaceæ*.

The small fleshy three- or four-toothed perianth becomes spongy and thickened in fruit, inclosing the ovoid utricle, which contains a single erect seed destitute of albumen, having a conduplicate embryo with two thickish seed-leaves. The species are native of saline soils throughout the world, and are remarkable for their smooth, fleshy, leafless, and jointed stems, erect or decumbent, and bearing many short branches, their numerous joints dilated above into sheaths which form a socket partly inclosing the next higher joint. Their inconspicuous flowers form terminal fleshy and cylindrical spikes closely resembling the branches. See *glasswort* and *marsh-sampire*, also *crab-grass*, 2, and *juncus*.

Salicornieæ (*sal'i-kōr-ni'ē-ē*), *n. pl.* [*NL.* (Dumortier, 1827), < *Salicornia* + *-eæ*.] A tribe of apetalous plants of the order *Chenopodiaceæ*. It is characterized by bisexual flowers immersed in the axils of scales of a cone or in hollows of the stem, and by the fruit which is a utricle included in an unappended and generally somewhat enlarged perianth. It includes 11 genera and about 31 species, many of them natives of salt-marshes. They are herbs or fleshy shrubs, with continuous or jointed branches, often leafless.

Salix (sā'liks), *n.* [NL. (Tournefort, 1700), < L. *salix*, a willow: see *sallow*.] A genus of apetalous trees and shrubs, the willows, type of the order *Salicinae*, and characterized by a disk or perianth reduced to one or two distinct glands, and a one-celled ovary with a short two-celled style, and two placentae each bearing commonly from four to eight ovules, arranged in two ranks.

Unlike those of *Populus*, the other genus of the order, the leaves are commonly long and narrow, the catkins are dense, erect, and at first covered by a single bud-scale, the flowers sessile, stigma short, stamens usually but two, the bracts entire, and the seeds few in each two-valved capsule. There are over 160 species enumerated, often of very difficult limitation from the number of connecting forms and of hybrids. They are natives of all northern and cold regions, rare in the tropics, and very few in the southern hemisphere. One species only is known in South Africa, and one in South America, native in Chili; none occurs in Australasia or Oceania. About 20 are native to the northeastern United States; and they are

still more numerous northward, 10 species being reported from Point Barrow in Alaska alone. They are trees or shrubs, generally with long little branches and elongated entire or minutely toothed leaves, often with conspicuous stipules. A few alpine species are prostrate, and form matted turfs or send up small herb-like branches from underground stems. *S. arctica*, a wide-spread species of the far north, extends to latitude 81° 44' N. In the form, at sea-level, of dwarf shrubs a foot high, but with a trunk an inch thick. The catkins are conspicuous; in temperate climates they are usually put forth before the leaves, but in colder regions they commonly appear nearly at the same time. Most species grow along streams, and many are widely planted to consolidate banks, and thus have become extensively naturalized. Many are found in a fossil state. See *willow*, *osier*, and *sallow*; also cuts under *ament*, *inflorescence*, *lanceolate*, and *retuse*.

about 150 scales in a longitudinal row, 16 anal rays, 15 to 19 branchiostegal rays (those of the opposite sides often unlike), and the back and upper fins dotted with black. It reaches a weight of over 100 pounds, but the average in the Columbia river is still more numerous into the northern streams from both sides of the Pacific, and is by far the most important species of its genus. About 30,000,000 pounds are estimated to have been the average take for several years in the Columbia river alone, along whose banks extensive canneries are established to preserve the fish. (d) The silver or kishutch salmon, *O. kisutch*, has about 25 rather slender gill-rakers, rather large scales (about 130 in a row), and is bluish-green on the back, silvery on the sides, and punctulated with blackish, but without decided spots except on the top of the head, back, dorsal and adipose fins, and the upper rudimentary rays of the caudal fin. It grows to a weight of from 3 to 8 pounds, and is abundant southward to the Sacramento river, but is of little economic value. (e) The blue-back salmon, *O. nerka* or *O. tshawytscha*, has about 30 or 40 comparatively long gill-rakers, rather large scales (about 130 in a row), and is normally colored bright-blue above and silvery on the sides, but the males in the fall become deep-red, and are then known in the interior as *redfish*. It attains a weight of from 4 to 8 pounds, and ascends the Columbia river and tributaries in abundance. It ranks next in value to the quinnat. In naming salmon in America the fish are cooked in the cans in which they are put up, unlike any fish canned in Europe, which are all cooked first and then canned and packed again. (See *sardine*, 1.) The salmon are first

cleaned and scaled, and have their heads, tails, and fins cut off. Then they are placed in tanks filled with salted water, where they remain some time to "slime" or be cleansed before being brought into the factory. They are then cut into pieces of the proper size to fill the cans. These pieces are placed in cans, which are subsequently filled with brine. The raw fish, thus pickled, are soldered in the cans, which are next placed on forms holding many hundreds and lowered by machinery into steam-boilers, where they are cooked for an hour. The next step is a nice process called *venting*. A little hole is pricked in the can to allow the gas within to escape, when the vent-hole is instantly soldered. A second cooking now takes place, after which the cans are taken from the boilers and showered with cold water. If the vacuum is perfect, showing a sound can, the top hollows in with the cooling process. If a can is in the least swollen, it is rejected.

3. One of various fishes, not of the family *Salmonidae*, suggestive of or mistaken for a salmon. (a) A scienoid fish, *Cynoscion maculatus*. See *squeteague*. [Southern coast of the U.
